NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. TRADE NOTES.

Messrs. Hill & Smith, the well-known art metal founders, of Brierley Hill, Staffordshire, have registered their business as a limited liability company.

Mr. Frank Stuart Milne, who some time ago left the Newcastle-upon-Tyne Electric Supply Company, Ltd., to take up an important appointment in the Argentine in connection with the Electrical Department of the State Railways, has, in view of the rapid commercial expansion of the Republic, commenced business in Buenos Aires as commercial engineer and agent for British railway mechanical and electrical engineering firms. Associated with him as British Engineer and Secretary is Mr. J. A. Seager, A.M.I.C.E., A.I.E.E., and any firm desiring representation should communicate with the latter gentleman at his office, Emerson Chambers, Newcastle-on-Tyne.

Under the direction of Mr. A. Smith, county surveyor, Boyle's latest patent "air-pump" ventilators have been applied to the new school, Rye Park.

The firms of Lenzberg & Wilson, cornice-pole manufacturers, and Messrs. G. F. Jones & Co., window-blind manufacturers, have been amalgamated, and will be carried on in future at 92 Tabernacle Street, Finsbury, E.C., under the title of Wilson & Jones, Ltd.

ILLUSTRATIONS.

BOYS' SECONDARY SCHOOL FOR THE BOROUGH OF BROMLEY, KENT.—DETAILS OF PRINCIPAL ENTRANCE.

THE "FILESMITHS' ARMS," SHEFFIELD.

SHOPS AND OFFICES, WAKEFIELD.

REBUILDING OF NETHER SWELL MANOR, GLOUCESTERSHIRE.

VARIETIES.

Mr. E. Douglas Hoyland, architect and surveyor, has removed his offices from 2 Walbrook, E.C., to 10 John Street, Adelphi.

The Woking Urban District Council are going to proceed with the construction of a swimming bath at the recreation ground, at an estimated cost of 450*l*.

The Basingstoke Town Council are going to apply to the Local Government Board for sanction to borrow the sum of 5,200*l*., according to estimate submitted, for the purchase of a field and for laying out 10½ acres. The borough surveyor has been instructed to prepare plans and specifications of necessary buildings accordingly.

The Hampshire County Council have approved the proposal of the education committee to erect at Eastleigh a technical school building and a pupil teachers' centre and manual instruction and science rooms to accommodate 200 pupils, at a cost of 7,550*l*.

The Inspector-General in Bankruptcy in his annual report states that in England and Wales during 1908 the total number for builders was 291, against 308 for the preceding year. Under the heading "Decorators" the total for last year was 102, this number being seventeen less than in 1907.

Mr. William Shearman, of Winchester, builder, who died May 24, left estate of the gross value of 18,444*l*. 12*s*. 10*d*. Probate of his will has been granted to his son, Mr. Sidney Robert Shearman, builder, of 1 Southgate Villas, Winchester, and two others. The testator left 300*l*. and all stock-in-trade, plant, and tools of his business as a builder, and use of yard and buildings in Staple Garden to his son.

The ringing of the bells in the town church steeple, Dundee, is to be performed in future by electricity. At a meeting of the works sub-committee of the Town Council tenders were received for the electric installation, and that of Mr. T. C. Keay, engineer, who offered to do the work for 39*l*. 9*s*. 6*d*., was accepted.

A special conference will be held at Ipswich on September 4 in connection with the annual Trade Unions Congress for the joint purposes of discussing the best means of making effective use of the Housing, Town-Planning, &c., Bill when it becomes law, and of securing an amendment of the Cheap Trains Act.

Messrs. Easton Gibb & Son, the Rosyth Naval Base contractors, have a good record so far as immunity from accidents at their undertakings is concerned, if we except the case of the recent disaster at Newport Dock. In course of last week's inquiry into that accident it was stated that, while insurance companies estimate that a man dies for every 33,000*l*. expended on public works, Messrs. Easton Gibb & Son had lost only one man for 170,000*l*. of work.

The north-east district education sub-committee of the Durham County Council are considering a recommendation to provide an upper standard school to serve New Seaham and Seaham Harbour. The drill field has been suggested as a site which would be central for the whole area. The cost is estimated at 9,057*l*. In addition it is urged that a new school, costing 6,538*l*., should be provided at New Seaham. The sub-committee also propose to build a secondary school at Pelaw.

At a special meeting of Helensburgh Town Council on Tuesday, the 10th inst., Provost Maclachlan presiding, the gasworks committee submitted a report upon the improvement and reconstruction of the carbonising plant and other extensions at the burgh gasworks. After some discussion the Council authorised the committee to prepare specifications and get estimates as to the cost of the proposed improvements and extensions, which it is expected will cost something like 12,000*l*.

At the quarterly meeting of the Morecambe Town Council on Monday, an important improvement scheme was adopted. It was decided to widen the promenade from the Winter Gardens to the West End Pier to a uniform width of 80 feet;

to build a new sea-wall from a point opposite Highfield to the West End Pier ; to double the tramway track to afford greater facilities for the working of the system ; to erect bandstands and construct underground lavatories, shelters, and flower beds, the whole to cost about 13,000*l*. It was further resolved that the work should be put in hand as early as possible, in order that it may be completed for the opening of next season.

Sir Henry Hibbert, chairman of the Lancashire education committee, distributed last week at Preston the prizes won by students at the plumbing classes in a special series of examinations in practical work conducted at the chief educational centres in Lancashire. Sir Henry said that, so far as he could gather, Lancashire stood alone at present in regard to these practical tests of workmanship. The reason was that the county education committee attached a high degree of importance to successful craftsmanship in plumbing, not only from the hygienic, but from the trade point of view. To a very large extent they had been helped by the Plumbers' Company.

The Burton-on-Trent Town Council have agreed to construct the sewers required on the premises of Samuel Allsopp & Sons, Ltd., and Ind, Coope & Co., Ltd., which are necessary for the separation of the foul water from the clean water, and for connecting the foul water with the Corporation low-level sewer, provided that an agreement could be entered into with the proper parties for the Corporation to carry out efficiently the sewerage referred to on those respective premises. The approximate estimated costs are:—New main sewer at Allsopp's brewery, 1,000*l*. ; separation at Allsopp's brewery, 1,250*l*., and on Ind, Coope & Co.'s, 500*l*., a total of 2,750*l*.

The granite contract for Rosyth is not yet settled. Mr. J. M. Henderson, whose zeal in the interest of Kemnay is unlimited, has received (says the London correspondent of the *Aberdeen Free Press*) a letter from Messrs. Easton Gibb & Co. stating that they were about to give British granite owners an opportunity of offering. Other things being equal, the contract would be given to a home firm. The Norway contract holds good only in the case of the contract going out of the United Kingdom. On the last occasion the quotation received from Sweden was some 20,000*l*. below that of the lowest Scotch tender.

The plans for a new racecourse for Paisley have been approved by the stewards of the Jockey Club. The course is situate at Barnsford Bridge, about two and a half miles north of Paisley Cross and three-quarters of a mile from Houston railway station on the Caledonian line. The plans show a course of one and a quarter miles in circumference. The paddock, stands, &c., adjoin the Greenock Road. The preliminary negotiations are not yet completed, but a start will be made as soon as possible, and it is anticipated that the course will be ready by 1912.

The new schools for the Durham County Council built at Whickham were formally opened on Tuesday. The schools are erected at the top of Whickham Bank, and consist of a mixed department for 400 children and infants' department for 200. The classrooms for fifty each are grouped round a central hall. The building, with playsheds, boundary wall, playgrounds, &c., has been erected at a cost of 9*l*. per head, exclusive of the cookery school, which also forms part of the scheme. The contractor for the whole is Mr. J. A. M. Henderson, of Jarrow. The architects were Messrs. Marshall & Tweedy, 17 Eldon Square, Newcastle.

The Warrington Town Council first considered proposals for the demolition or improvement or the existing Victoria Bridge across the Mersey about twenty years ago. It has now been decided that all firms constructing ferro-concrete bridges are to be invited to send in designs and estimates for a ferro-concrete bridge 80 feet in width. An expert will then be appointed to examine and advise the Council which design to adopt. When these preliminaries have been settled, the Council, it is expected, will at once proceed to build the new bridge.

The Royal Commission on Sewage Disposal held its first meeting on June 21, 1898. There have been ninety-three formal meetings for taking evidence, in addition to a large number of other sittings. Six reports have been issued in several volumes, varying in cost from a few pence to 14*s*. 9*d*. Up to July 31 last the total cost of the Commission was 57,578*l*., including the net cost of stationery and printing, but excluding the cost of accommodation. It is hoped that the final report will be issued in the course of the next eighteen months. In the meantime there may be a further report on standards for sewage effluents.

RUBEROID
SYSTEM OF ROOFING

THE
RUBEROID
SYSTEM OF ROOFING
has stood the test of 17 years' actual use, and time has proved it the best, both on boards and concrete. RUBEROID is made in three colours : Grey, Red, and Green. It is suitable for the most permanent buildings, while its low cost makes it an economical covering for temporary structures.

The committee of the Japan-British Exhibition to be held at the Great White City, Shepherd's Bush, W., next year, under the auspices of the Imperial Japanese Government, have issued a letter, signed by His Royal Highness Prince Arthur of Connaught, as honorary president, and the Duke of Norfolk, as president, appealing for general support. In the course of the letter it is said:—"The value of the traditional art of Japan and the influence it has exercised on the fine and industrial arts of the world cannot be overestimated, and on the occasion of this Exhibition the nobles of Japan will pour out, from the treasures they have accumulated for centuries, works of art never before seen in this country and only by a favoured few in Japan. The committee joins us in appealing to possessors of the treasures of British art to make a like revelation of those priceless works, many of which are but little known to the general public, so as to equal, and if possible eclipse, the magnificent display of art at the Franco-British Exhibition. The unique character of the Exhibition is sure to attract multitudes of people, not only from Japan and the United Kingdom, and the Colonies and Dependencies, but from every European country and from America, and cannot fail to increase the commerce of the two nations and to create new commercial channels between them and the rest of the world. We therefore trust that the manufacturers and producers of this country, as well as those of the rest of the British Empire, will rise to the occasion by displaying the best of their respective productions in arts and industries, so as to make a representation worthy of this great opportunity."

The official testings of the ferro-concrete bridge at Stakeford over the river Wansbeck were carried out on Monday, under the superintendence of Dr. A. W. Brightmore, Government Inspector. Among those present were Mr. D. Balfour, jun., representing the engineers (Messrs. D. Balfour & Son, of Newcastle); Mr. J. A. Bean, county surveyor; Mr. T. J. Gueritte, of Messrs. Mouchel & Partners, London; Mr. C. W. Brims, of Messrs. Brims & Co., contractors for the work. The length of the structure between abutments is 264 feet, which is divided into six spans of 44 feet each. There is a 20-foot carriageway and a 4-foot footpath. The borings for the foundation showed that rock was found 37 feet from the surface on the south side, 24 feet in the centre of the river, and 20 feet on the north side, with bands of rock nearer the surface. The whole structure is carried by 14×14-inch ferro-concrete piles driven down to the rock by a Lacour steam piling machine with a 1½-ton ram and a drop of 5 feet. In no case has the set of the piles with ten blows exceeded a quarter of an inch. The abutments consist of ferro-concrete carried on a piled foundation properly braced. Each pier has two ferro-concrete cylinders, each enclosing two piles having vertical steel bars embedded in concrete filling and cross-braced together. The main girders rest on piers and carry the cross girders which support the decking of the roadway, on which is laid tar macadam for carriageway and cement concrete for footpath. On each side of the roadway there is an iron handrailing, with pillars at each pier. The bridge was tested first by two 16-ton steam rollers standing side by side in the centre of each of the six spans, when the deflection was found not to exceed one-eighth of an inch on any span. The engines were then run across the bridge at varying speeds, when the above deflection was not exceeded. The maximum deflection allowed by the specification was three-quarters of an inch. The Inspector expressed his entire satisfaction with the result of the testing, and all present were agreeably surprised at the small amount of deflection shown under the severe load and at the absence of vibration when the engines were travelling at varying speeds across the bridge. The official opening of the bridge will take place next month on the completion of the approach roads.

THE BUDGET AND THE AUCTIONEERS' INSTITUTE.

The following important memorial has been forwarded to the Chancellor of the Exchequer by the Auctioneers' Institute of the United Kingdom:—

The Humble Memorial of the Auctioneers' Institute of the United Kingdom, 34 Russell Square, London, W.C.

Sheweth—

1. That your memorialists are the Council of the Auctioneers' Institute of the United Kingdom, which numbers 2,250 members, living and practising in various parts of the United Kingdom, who, by reason of their wide and varied experience in the development, sale, purchase, management and valuation of estates, and their practical dealings with

land and all interests in land, are enabled to appreciate the probable practical effects of the provisions of the land taxation clauses of the Finance Bill relating to land and interests in land.

2. After careful consideration of the Bill, your memorialists are convinced that many of the provisions therein contained, if enacted and enforced, would operate inequitably, and result in grievous loss and injury to those interested in land either as freeholders, lessees, mortgagees, or trustees; would tend seriously to increase unemployment, particularly in the building and allied trades, and would undoubtedly discourage investment in land or interests in land (including small investments) by depriving property in real estate of the security which has hitherto attached to it, and which is of vital importance.

3. Your memorialists know from their practical experience that the said proposals relating to the taxation of land values, following upon the unprecedented liabilities and restrictions proposed to be placed upon owners by the provisions of the Housing, Town Planning, &c., Bill are viewed in the property market with the gravest apprehension.

4. The insecurity created by the said legislative proposals has already resulted in depreciating the values of freehold and leasehold securities, in the restriction of business, and the withdrawal from the market of many investors, thus effecting the arrest of development and increase of unemployment.

5. Your memorialists have considered the effect of the proposed increment value duty, reversion duty, and duty upon undeveloped land.

A purchaser buys land with all its liabilities and potentialities, and the price paid represents not only the capitalised value of its present productiveness, but also the present capital value of any increase in its income-producing power at any future date. It follows, therefore, that if he be deprived of any portion of that increase by the State (as is now proposed) he is being deprived of that for which he has already paid the full market value.

The proposed reversion value duty is, in the opinion of your memorialists, an encroachment upon a right established both in law and equity, and a violation of existing contracts.

A man buying the freehold interest, subject to a lease, pays the market price not only of the capitalised value of any reserved rental, but also of the capitalised value of the full annual income which the property is expected to yield at the expiration of the subsisting lease. Therefore, to deprive the owner of any portion of that reversionary value is to take from him that for which he has already paid full value.

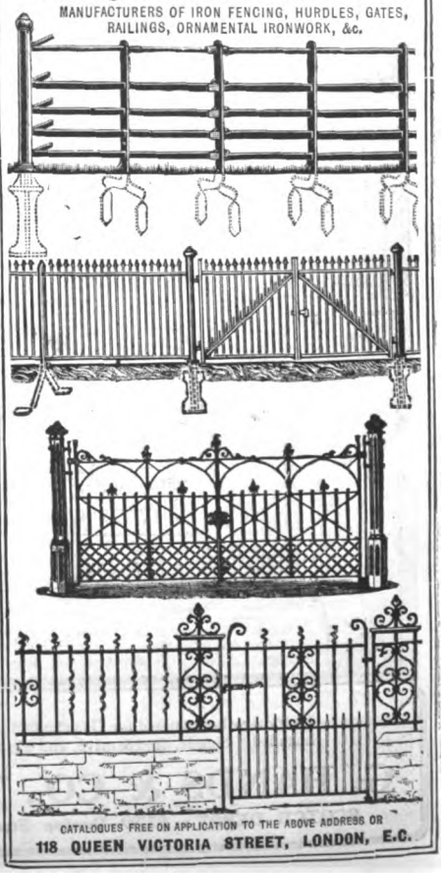
6. The proposal to tax undeveloped land is also open to serious objection.

In many cases it would in effect penalise the owner of land who would willingly sell, but who could not do so because there would be no immediate demand for land for building purposes.

It is within the knowledge of your memorialists that there are thousands of acres awaiting development, but which cannot be so dealt with immediately because the supply of houses in the respective localities in which such lands are situate already exceeds the demand.

7. The impossibility of calculating with any degree of certainty the amount and incidence of future taxation is a matter of vital importance, and the result must inevitably be not only a depreciation in value of land or interests in land, and consequent loss, but also the total destruction of that element of security which is essential for investment purposes.

8. For the purposes of development of estates and for the provision of houses, it is of first importance that there should always be available an abundance of capital at a low rate of interest. The supply of capital and the rate of interest are governed by the quality of the security offered for ensuring repayment of borrowed capital. Any legislative enactments which impair the security have the effect of raising the rate of interest at which money can be obtained and of restricting the supply of available capital and calling in of mortgages, thus arresting the normal development of land and the provision of dwellings until such time as the demand for houses exceeds the supply, and the consequent enhanced rentals obtainable (owing to scarcity of accommodation) make building enterprise again profitable and therefore practicable.



Your memorialists know by actual experience in their business that development has already been arrested as a direct consequence of the proposals contained in the Finance Bill.

9. Your memorialists append hereto a schedule containing examples (based upon recent or current prices), showing to some extent how the taxation proposals will affect values. These examples, however, do not and cannot show fully what

the effect of the proposals will be, because the insecurity which is being created cannot fail to have far-reaching results. It is probable that investors will not acquire interests in real estate in the future except at prices which will show a much higher rate of interest upon their invested capital than has heretofore been obtained; in fact, the ruling market prices are sufficient indication that such will be the case. Logically, the inevitable result will be—the cessation of building enterprise or an increase in rents.

10. Your memorialists therefore humbly pray that Clauses 1 to 28 (inclusive) of the Finance Bill be withdrawn.

And your memorialists will ever pray, &c.

Given under our seal this 13th day of August, 1909.

The Common Seal of the Auctioneers' Institute of the United Kingdom affixed hereto, in the presence of—

ARTHUR G. WATNEY, President.
ARTHUR GEO. DILLEY. } Members of the Council.
CHARLES HARRIS, Secretary.

THE SCHEDULE

Referred to in Clause 9 of the Memorial.

EXAMPLE 1.—SHOWING EFFECT OF REVERSION DUTY.

In May, 1907, sold at auction, London property comprising freehold ground rents amounting to 39*l.* per annum, with reversion in 1940 to premises of the rateable value of 448*l.* per annum. Price realised 1,810*l.* This sum was 17*l.* more than the auctioneer's estimate, which was as follows:—

For the ground rent till 1940 . .	£763
For the reversion after 1940 . .	1,030
Total value	£1,793

Under Clause 7 of the Finance Bill, as drawn, the reversion duty payable in respect of the "value of the benefit accruing to the lessor by reason of the determination of the lease" would be 766*l.*

Notes.—1. At the time the purchaser bought, he had no reason to think that the Government, by means of the legislature, would deprive him of 766*l.* He was entitled to assume that the Government would not intercept any part of that for which he had paid full value.

2. During the period 1907-40 the income receivable by purchaser (after deducting property-tax) would be only about 37*l.* per annum, representing 2.04 per cent. per annum on capital invested.

3. This investment is depreciated in value now by reason of the proposed taxation, the amount of which might at any time be increased.

EXAMPLE 2.—SHOWING EFFECT OF REVERSION DUTY.

In May, 1907, sold at auction, London property comprising a freehold ground rent of 1*l.* 19*s.* 11*d.* per annum, secured upon trade premises, reversion in 1940 to premises of the rateable value of 241*l.* per annum. Price realised, 600*l.* This was 10*l.* more than the auctioneer's estimate, which was as follows:—

For the ground rent till 1940 . .	£36
For the reversion after 1940 . .	554
	£590

Notes.—1. During the period 1907-40 the income receivable by purchaser (after deducting property tax) is only .316*l.* per cent. (or 6*s.* 4*d.* per cent.) on the invested capital.

2. The reversion duty payable in respect of the "value of the benefit accruing to the lessor by reason of the determination of the lease" would amount to 475*l.*

EXAMPLE 3.—SHOWING ASCERTAINED EFFECT OF PROPOSED TAXATION UPON MARKET VALUES.

In March, 1905, offered by auction and sold freehold ground rents, 150*l.* per annum, with reversion in 1944 to premises of the present assessed annual value of 892*l.*

Price realised in 1905, twenty-seven years' purchase	£4,050
Value in 1909 (on same basis), but having regard to the nearer approach to date of reversion, would be manifestly greater	
Offered by auction in 1909:	
Highest bid	£3,450

Showing ascertained depreciation of at least 600*l.*, or 14.8 per cent. of the price which, but for the Budget proposals, it was reasonable to anticipate.

The effect of the Budget proposals is, therefore, the immediate lowering of the saleable value of reversions, and the consequent deprivation of the owners of that for which many have paid a cash equivalent.

TESTS ON "CHECK FIRE" DOORS.

A few months ago two doors manufactured by the Check Fire Door Company, Kilburn, N.W., were tested by the British Fire Prevention Committee at their station, and the report has recently been issued. In view of the importance of fire-resisting doors we will briefly give the principal points and the results of the tests. Door A is thus described in the official Red Book:—

On the outer face of the door a sheet of iron $\frac{1}{352}$ in. (.0007 *m.*) thick was placed within the angle iron. Adjoining this the maker stated a sheet of asbestos composition was fixed, and abutting upon this a sheet of corrugated iron, followed by a further sheet of asbestos composition and a sheet of asbestos slate. The inner face of the door was formed by a sheet of perforated iron $\frac{1}{352}$ in. (.002 *m.*) thick. The whole of the above thicknesses were secured to the angle iron frame before mentioned by a cover strip 2 in. by $\frac{1}{4}$ (.051 *m.* by .006 *m.*) rivetted around the angle iron frame; there were also rivets over the surface of the door.

The precise thicknesses and character of the asbestos slate or composition and the precise character and arrangement of the corrugated sheets, &c., were considered by the maker of the door to be of a confidential character.

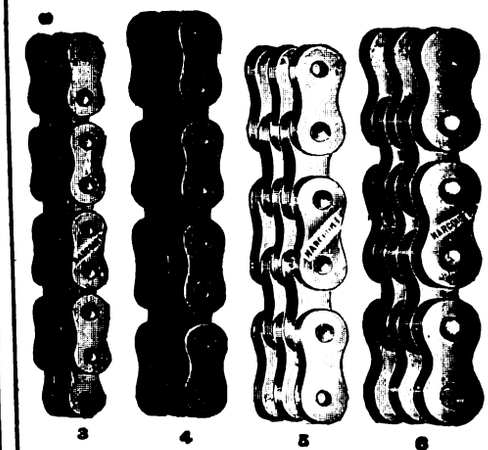
Across the entire width of the door three strap hinges $1\frac{3}{4}$ in. by $\frac{5}{16}$ in. (.044 *m.* by .008*m.*) were rivetted, one across the centre and the other two 9 in. (.229 *m.*) from the top and bottom of the door respectively.

These were connected by eyes to pivots let into the wall. Fitted into the brick rebate of the jamb was an angle iron outer frame, $2\frac{3}{8}$ in. by $1\frac{5}{8}$ by $\frac{5}{16}$ in. (.066 *m.* by .040 *m.* by .005 *m*), into which the door fitted; this was secured in position by lugs built into the brickwork and pointed in cement. The door was secured by a lock, the bolt of which shot into a staple plate welded on to the frame.

Door B was identical with the above, except that it had no outer frame and the position as to the face exposed was reversed.

The object of the test was to record the effect of a fire of four hours' duration at a temperature rising to 2,000° F., followed by the application of water for five minutes on the fire side.

Twenty-five minutes after the gas was lighted the temperature inside the chamber had risen to 1,180° F., and the top of the door was too hot to allow the hand to rest upon it. In eighty minutes a top corner commenced to buckle inwards, and continued to do so until the end, when it amounted to $1\frac{1}{2}$ inch. Buckling also occurred to a small extent down the sides in the course of the test. After two hours the face of the door had become red hot, yet when paper was laid on the outer face half an hour later it did not scorch. By that time flame appeared over the top of the door, as also happened down one side fifty minutes later. The outside of the door became red hot in places before the test was completed, though the maximum reading of the hanging thermometer in front did not exceed 80° F., while paper attached to a post in front of the lower part did not take fire. The final temperatures after the four hours' test were 2,100° F. inside and 200° F. outside.



Tests with door B were proceeding simultaneously. In 110 minutes the top corners buckled outwards, the maximum after 215 minutes being $1\frac{1}{2}$ inch. In two hours and a half flame came over this corner. At the conclusion of the test water was applied for five minutes on the inside, with the result that the door contracted to almost its original position and the buckling became invisible. The maximum reading of the hanging thermometer was even less than the other, being 72° F., while as with the other the paper fixed in front did not take fire. The final temperature inside after four hours was 2,080° F. and outside 190° F.

Beulah Spa, on Beulah Hill, Upper Norwood, was a fashionable resort during the first half of the last century, and the Spa House was erected about 1832, under the directions of Decimus Burton, the architect. The existing Beulah Spa Hotel and Hydropathic Establishment indicate the site on the crest of the Norwood Hills, 320 feet above the sea, and but a short distance from the Crystal Palace. It is interesting to record that in 1834 an open-air concert was given in the gardens, when the ill-fated Malibran was prima donna, and a brilliant assembly thronged the lawns to hear her. The gardens, from which there is a view of the country beyond extending to Banstead Downs and even Windsor Castle, appear from contemporary accounts to have resembled a miniature Switzerland, and the old-world grounds, six acres in extent, still retain their charming aspect.

THE CITY AND PUBLIC HEALTH.

The report of Mr. Frank Sumner, M.Inst.C.E., city engineer, on the works executed by the Public Health Department of the Corporation of London during 1908 so far as they relate to the engineer's department extends to 60 pages. Several matters of general interest are mentioned, including the following:—

Improvements.

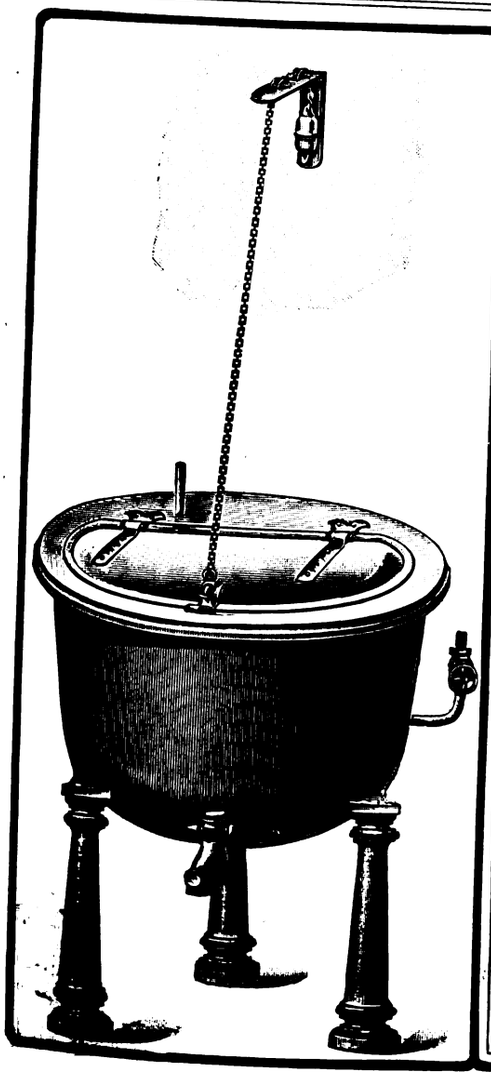
The negotiations with the London County Council as to their contributing towards the cost of widening Bishopsgate Street Without, which were started in 1903, were completed by the receipt in November, 1908, of an intimation that they were prepared to contribute 156,950*l.* towards the widening the street to 70 feet, it being understood that the Corporation will offer no opposition to the construction of a tramway in the portion of the thoroughfare between the City boundary and Middlesex Street. Notices to treat are now being served upon the owners for the acquisition of their interests.

In connection with the widening of Fleet Street, negotiations were entered into with respect to various properties, but they were all deferred, pending a report and estimate dealing with the widening as a whole. This was laid before the committee in July, and in November the Court of Common Council were recommended to complete the improvement forthwith at a cost of 500,000*l.*, subject to the London County Council contributing one-half of the net cost; this was agreed to, and the Council have been written to accordingly, and a conference with them has been suggested.

Claims amounting in the aggregate to about 31,000*l.* have been negotiated during the past year, and were settled for about 14,000*l.* At the end of the year claims to the extent of about 34,000*l.* were under negotiation.

Experimental Pavement.

Permission was given the British Cork Asphalt, Ltd., to lay a specimen of "cork asphalt" in the carriageway of Godliman Street from Knightrider Street to Queen Victoria Street. This portion of the thoroughfare has a gradient of 1 in 22, and is therefore much too steep for asphalt and unsuitable for wood pavement, but the patentees claimed that their material would prove successful even with this gradient. The pavement is composed of bitumen, cork and other materials compressed into blocks, 9 inches by 4½ inches by 2 inches, laid on a 6-inch Portland cement concrete foundation. The experimentors undertake to lay the pavement free of cost and to maintain the same for two years, and in the event of its proving unsatisfactory the Corporation are empowered to take it up and substitute similar material to that which originally existed, or any other pavement, the whole cost to be borne by the applicants. The work was commenced on the 16th and completed on the 30th March, but has not been laid sufficiently long to form an opinion as to its suitability.



Street Watering.

The quantity of water used during the year for washing and watering streets and courts was 71,582,011 gallons, the number of nights when it was used being 296. From June to September inclusive the gullies were disinfected at least once a week, and in many places a daily disinfection was carried out, while in the streets adjoining Billingsgate Market the gullies are usually disinfected three times a day during the summer months.

In the report last year reference was made to the additional work imposed upon the cleansing department owing to the large quantities of oil deposited upon the pavements from the many motors, particularly omnibuses; this nuisance has during the past year been considerably abated, due to the police authorities taking action against offenders, but although the evil has been reduced, it is stated that there is still room for improvement, either by the introduction of a more effective intercepting tray or improved motive power.

Motor Vans.

The Corporation have at work six motor vans, which are used both in connection with the removal of refuse and the watering of streets. The prices were 750*l.*, 725*l.*, and 600*l.* The expense of maintaining these vehicles is very considerable, due largely to the mechanism continually requiring to be overhauled on account of the strain to which they are subjected by reason of the frequent stoppages and reversing of the gear on account of the enormous traffic and other conditions prevailing in the City streets. Furthermore, the cost of fuel and oils is a considerable item in the accounts, and it is a matter for serious thought as to whether or no the present type of traction is a suitable one for City work.

Write for List.

Hornchurch Wharf.

With the exception of matter to which a commercial value is attached, all the refuse collected in the City was removed by barges from Letts' Wharf to the Corporation shoot at Hornchurch Marshes. It was decided to invite tenders for the erection of a new wharf 300 feet in length—instead of 400 feet as at present—to be built at the eastern end of the present wharf, and for this alternative plans and estimates were prepared, viz.:—(1) In ferro-concrete; (2) in timber; (3) for a solid wharf wall of masonry or concrete. Tenders were duly received and considered on these lines, and the choice ultimately fell upon a timber structure. The work is now being proceeded with.

Underground Conveniences.

No record is kept of the number of people using the conveniences, but some idea of their utility may be gathered from the fact that 7,351*l.* 13*s.* 7*d.* was received during the year under review for the use of the water-closets and lavatories. The total cost of the upkeep of the structures during the year was 10,714*l.* 4*s.* 11*d.* Plans and specifications were prepared and approved for a new convenience for men, and extensive alterations to the existing convenience in front of the Royal Exchange; also for a new convenience for both sexes at Eastcheap. Tenders were invited, and the work will probably be commenced during the next year.

Demolition of Buildings.

During the year applications were received for permission to erect hoardings for the demolition of buildings at various sites within the City. Owing to casual labour employed on the work, great difficulty is experienced in seeing that the bye-laws are carried out in their entirety, but every effort is being made to enforce them, particularly with regard to the usage of a plentiful supply of water.

Clocks.

Since March, 1903, it has been a condition that all overhead clocks fixed after that date shall be synchronised according to Greenwich mean time. This condition appears to be very necessary, as one cannot help thinking it would be an inestimable boon to the many thousands of persons frequenting the City if the Corporation compelled all owners of clocks overhanging the public way to keep them synchronised. At present it is a rarity to find two unsynchronised clocks alike. Only twenty-eight of the eighty-six private clocks fixed above the public ways of the City, and none of the twenty-nine church clocks are synchronised, but all clocks erected or overhanging the public way have been synchronised since 1903, when the standing order was passed.

Dangerous Structures.

During the year 118 buildings were referred to the dangerous structure surveyor, all of which were certified as dangerous; the usual notices were served, and the necessary steps taken to see that the same were complied with.

Overhead Wires.

Since the year 1899, when the Corporation took in hand the work of supervision, a total of about twenty-five miles of derelict wires have been removed by the inspector of overhead wires. The number of spans of telegraph and telephone wires now crossing public thoroughfares totals about 733,828, compared with 733,200 last year, and 260,000 in 1899. There has been a net increase of about 755¾ miles of National Telephone Company's wires, whilst other companies and private owners have added about twenty-two miles to their lines.

The committee promoting the erection of a church at Barnet Green, Worcestershire, intend to begin at once the erection of a portion of it at a cost of 1,200*l.*

The works sub-committee of the Dundee Town Council were engaged last week in discussing and settling a dispute that arose in the course of the installation of the water supply for the new electric station. The parties at variance were the plumbers and the coppersmiths, and the point at issue had reference to the line of demarcation between the work of the two trades. The plumbers held that all the work concerned fell legitimately within their sphere, while, on the other hand, it was argued that the specifications provided that the copperwork was to be done by coppersmiths. A strike occurred over the matter. After a lengthy discussion it was decided to recommend the Town Council to abide by the terms of the specifications, the brazing and bending to be done by the coppersmiths.

WILLESDEN UNDERLINING PAPER

Art Plates from "The Architect."

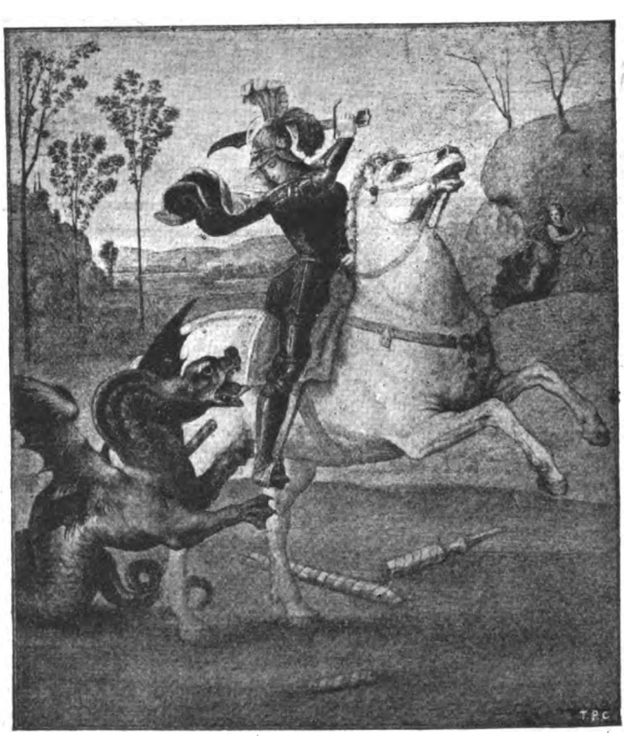
AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.

***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. Paul Albert Baudoin. This magnificent Illustration was presented to the Subscribers to "The Architect," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.*



AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

Galatea.

From the Painting by Raphael in the Villa Farnesina, Rome.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable substance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

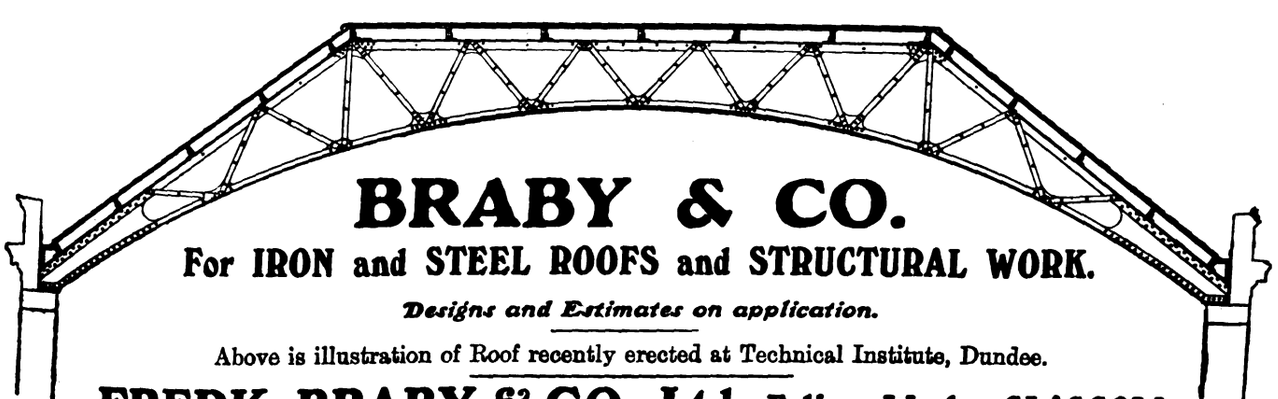
No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*



COMPETITIONS OPEN.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. Assessor, Mr. J. S. Gibson, V.P.R.I.B.A. Deposit 1*l.* 1*s.* Competition is limited to architects practising in the city or county of London. Mr. Vivian Orchard, Town Clerk, Town Hall, New Cross Road, S.E.

Winchester.—Sept. 1.—For erection of the central hall and other works at Peter Symonds's school. Messrs. Cancellor & Hill, architects, 12 Jewry Street, Winchester.

Woolwich.—Sept. 1.—For erection of open-air wards at the infirmary, Plumstead. Deposit 2*l.* 2*s.* Messrs. Church, Quick & Whincop, architects, William Street, Woolwich.

The partnership previously existing between Messrs. Grainger, Kennedy & Little, architects and civil engineers, Melbourne, Australia, has been dissolved. Messrs. Grainger & Little will carry on the late firm's practice at Salisbury Buildings, Melbourne.

The building trade at Bothwell, N.B., is reported to be booming. There is at present in course of erection at Bothwell a large chapel school for the Roman Catholic community of Bothwell and Hamilton Palace Colliery districts. The school is estimated to cost 8,000*l.* There is also in course of erection adjoining the fountain a group of buildings to be known as the Donald Institute, the ground and cost of buildings being gifted to the village by the late James Donald, a native of Bothwell. Owing to the abnormal growth of Bothwell Haugh, "Palace Colliery," the School Board have issued schedules for the erection of a second school, and the work will be proceeded with at once. A petition has also been submitted to the Bothwell School Board to erect a school at Bothwell Park, a large colliery district midway between Bellshill and Uddingston.

A long discussion took place on Monday last at a meeting of the Sheffield education committee concerning a recommendation that the tender of the Corporation's electric supply department should be accepted for providing and fixing the necessary appliances for lighting the new hostel for men students at Southbourne, Clarkehouse Road, by electricity. Thirteen tenders were received, and that of the department was by no means the lowest. Eventually a tender amounting to 127*l.* was accepted.

TRADE NOTES.

Messrs. Hobbs, Hart & Co., of Arlington Works, Arlington Street, N., and of Cheapside, inform us that they are supplying the whole of the iron and steel doors that are being extensively introduced into the Mansion House under the direction of the City Surveyor, with a view to fire resistance. A paragraph concerning these improvements appeared in our columns last week.

Among the contracts recently in hand by Messrs. E. H. Shorland & Brother, of Manchester, are the following:—The extensions to the East Ham isolation hospital are being warmed and ventilated by means of their double-fronted patent Manchester stoves with descending smoke flues and special inlet ventilators; the Pear Tree Church, near Southampton, is being ventilated by means of their patent exhaust roof ventilators and special inlet ventilators; the Children's Home for the Lancaster Union is being warmed and ventilated by means of patent Manchester stoves with descending smoke flues; the Chilvers Coton new schools are being ventilated with patent exhaust roof ventilators.

The Directors of the London and Lancashire Fire Insurance Company have appointed Mr. J. S. Proctor as lieutenant to Mr. Bentley, with the title of "local secretary" at the Manchester branch of the Company. Mr. Proctor has for some years occupied the position of local manager of the Aberdeen branch, and his new appointment follows the retirement on pension, owing to ill-health, of Mr. W. Hartley, the Company's local secretary at Manchester. Mr. Archibald F. Rae, hitherto resident secretary at the Dundee office of the Company, has been appointed to the position of local manager of the Aberdeen branch in succession to Mr. Proctor. Mr. Alex. Mackie, at present accident claims assessor, has been appointed to the position of resident secretary of the accident department of the Aberdeen branch, in which capacity he will assist Mr. Rae in the conduct of the accident business. Mr. Frank George Agg, who has until recently acted as the company's resident secretary in Durban, Natal, will fill the position of resident secretary at the Dundee office, rendered vacant by the appointment of Mr. Rae to Aberdeen.

VARIETIES.

Urr School Board, N.B., have approved of plans to extend the accommodation of the public school. The cost will probably be about 1,000*l.*

Pottery works are to be established in Dublin for the manufacture of delph, &c., of which at present about 80,000*l.* to 100,000*l.* is said to be imported every year into Ireland.

The Lochgelly School Board have agreed to feu a piece of ground in High Street, Lochgelly, N.B., from Mr. R. H. Thomson, of Park House, for a proposed school to accommodate 680 pupils.

The Carpenters' Company give notice of their intention of granting two free scholarships in connection with the classes on building construction and constructional drawing to be held at King's College. Particulars may be obtained of Mr. J. Hutton Freeman, Carpenters' Hall, London Wall.

The Royal Colleges of Physicians and Surgeons have disposed of their examination hall on the Victoria Embankment to the Institute of Electrical Engineers. The colleges have acquired a site in Queen's Square, Bloomsbury, Nos. 8 to 11, for a new hall.

Messrs. Somervail & Co., bridge builders, Dalmuir, Clydebank, booked some large orders last week. The Caledonian Railway Company have placed with them an order for nineteen renewal bridges on their system. In addition, they have received from the Clyde Trust an order to erect a large footbridge from Govan Road, Govan, to the docks near to the Allan Line sheds.

The foundation-stone of the new municipal buildings, Bethnal Green, is to be laid on September 23. The new structure is to cost between 30,000*l.* and 35,000*l.* The tender sent in by Messrs. Brand, Pettitt & Co., of Tottenham, amounting to 24,450*l.*, was accepted for the work, which is being carried out under the superintendence of Mr. E. E. Finch, borough engineer and surveyor.

The Liverpool city engineer has been instructed to prepare an estimate of the cost of providing an underground passage between the bottom of Water Street and the locality occupied by the new building of the Royal Liver Society.

Scagliola Marble

By Special Appointment

To His Majesty.

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the Scagliola can afterwards be fixed round **WITHOUT SHOWING JOINT.**

Prize Medals, 1851 & 1862.

A DECORATIVE MATERIAL of the RENAISSANCE WHICH HAS STOOD THE TEST OF CENTURIES.

COLUMNS, PILASTERS, WALL-LINING, DADOS, and all forms of INTERNAL DECORATION.

ILLUSTRATIONS.

ARCHITECTURAL ASSOCIATION EXCURSION 1909.

MR. W. J. LOMAX, architect, Bolton, has been instructed to prepare working drawings, specifications and quantities for a new library to be erected at Farnworth, Lancs. Mr. Andrew Carnegie, who has approved the preliminary plans, is giving 5,000*l.* to the work.

A MERGER of the cement companies of Canada has at last been completed. The capital is placed at 6,000,000*l.* Sir Sandford Fleming will be the president of the company. It is announced that the bonds will soon be placed on the London market.

ANOTHER extension of building operations is to commence at the Garden Suburb on the estate of Sir A. Paget, Bart., Heath Town, near Wolverhampton. The District Council have approved plans for a further fourteen houses, which, when completed, will form with others already erected a quadrangle with attractive features.

A DEPUTATION consisting of Mr. Carpenter (county surveyor for the West Riding of Yorkshire), Mr. Beaumont (surveyor to the East Riding), Mr. Bradley (surveyor to the Goole Urban District Council), and several members of the Yorkshire County Council, visited Newport on Saturday for the purpose of inspecting the transporter bridge over the Usk.

THE Burnley Town Council have appointed a committee to consider the offer made by Sir John Thursby to sell Bank Hall and the surrounding grounds to the town for 4,000*l.* The estate comprises 31 acres. The owner said that he preferred to offer the property to the Corporation for its future requirements rather than develop it as a building estate. He reserved only the right to the ungotten coal, which, he expects, will be got in about five years' time.

THE plans for the adaption of Seafield House, Seaforth, Liverpool, as an asylum for 345 male patients have now been approved in their preliminary form by the Lunacy Commissioners. The original estimate for altering the buildings was 13,500*l.*; in view of the amendments by the Lunacy Commissioners, the estimate is now 14,500*l.* The committee of the Lancashire Asylums Board, in order to avoid the delay consequent upon an application to the Local Government Board for a loan, recommend that the expenditure and the cost of furnishing, which is not included in the estimate, should be paid out of revenue, spread over three years.

THE British Consul-General at Hamburg referred in his report for 1907 to the formation of a company at Hamburg for utilising the tides at Cuxhaven for the purpose of producing electricity for making ice, liquid air, &c. During the past year, Sir W. Ward now states, the project does not seem to have advanced beyond this initiatory stage, but a meeting of the shareholders of the company was held recently at which it was announced that the construction of the works required for commencing operations will now take place. The managing engineer expressed at this meeting full confidence in the successful working of the undertaking, though some persons were of opinion that the costs would be too great to render it profitable.

IN the House of Commons last week the Prime Minister was asked if his attention had been called to the statement by the directors of the Piccadilly Hotel, Ltd., now in liquidation, that alterations in the designs of the building were insisted on by the representatives of the Crown, as landlord, which entailed an expenditure of about 160,000*l.*, and a further large loss owing to the diminished rental of shops sub-let in the building; and whether it was proposed to continue this system. Mr. Hobhouse replied as follows:—"I have seen the statement referred to, but there must, I think, be some mistake in it, as I am advised that the Crown requirements, which were in the main settled by the previous Government, could not in themselves have entailed the extra cost or loss in rental alleged. It is clearly desirable that, in the case of large rebuilding schemes on Crown property, due regard should be paid to architectural result, and I am not prepared to say that a slight additional expense is not sometimes justified for this purpose. At the same time, I can assure the hon. member that care is taken that commercial considerations are not overlooked; indeed, I am at the present moment considering the best method of securing these two objects in another important rebuilding scheme."

Captain Morrison-Bell recently asked the President of the Local Government Board if he could state the number of houses and tenements now unoccupied in each of the Metropolitan boroughs, and in Birmingham, Bristol, Leeds, Liverpool, Manchester, Portsmouth, Sheffield, and Glasgow. Mr. John Burns, in a printed answer in the Parliamentary papers, furnishes an interesting table. He points out that in some cases the figures are approximate only, and usually houses and tenements in respect of which the payment of rates is compounded for are not included, as information with regard to them is not available. The following are the figures:—Battersea, 2,064; Bermondsey, 426; Bethnal Green, 1,054; Camberwell, 3,911; Chelsea, 652; Deptford, 1,090; Finsbury, 1,650; Fulham, 1,047; Greenwich, 1,212; Hackney, 2,017; Hammersmith, 1,213; Hampstead, 956; Holborn, 789; Islington, 2,554; Kensington, 1,989; Lambeth, 3,500; Lewisham, 3,732; Paddington, 2,000; Poplar, 1,321; St. Marylebone, 1,324; St. Pancras, 1,157; Shoreditch, 1,296; Stepney, 2,684; Stoke Newington, 449; Westminster, 2,175; Woolwich, 1,276; Birmingham, 8,461; Bristol, 4,850; Leeds, 6,875; Liverpool, 6,900; Manchester, 9,928; Portsmouth, 1,652; Sheffield, 4,907; and Glasgow, 17,000. In the cases of the Metropolitan boroughs of Southwark and Wandsworth no information is available.

The principal lining granted at Glasgow Dean of Guild Court last week was for buildings in connection with the reconstruction of the Glasgow Royal Infirmary. The plans passed are for a portion in Castle Street, the estimated cost of which will be about 89,000*l*. Another important lining was for the erection of a Roman Catholic church and presbytery in Dixon Avenue and Belleisle Street, Govanhill, at a cost of 15,000*l*., for Archbishop Maguire and others. Several other plans were also passed on the 19th inst. The plans in connection with the Royal Infirmary above mentioned are for the second instalment of the main building, now in course of erection. The portion already erected comprises about two-thirds of the surgical block, the remaining third being embraced in the portion now about to be proceeded with. In addition to this it comprises the central block, which contains the administrative department and department for special diseases. The central block is cut off from the blocks on either side of it by large archways, which form a conspicuous feature in the quadrangle front. The main entrance is in the centre of the special diseases block, and leads to a large entrance hall which has a gallery at every floor, the circular well running to the top of the building. This hall is lighted on three sides and also from the roof. Mr. James Miller, A.R.S.A., 15 Blythswood Square, Glasgow, is the architect for the building.

The contract for the erection of County Council offices at Winchester (Mr. W. J. Taylor, county surveyor) has been awarded to Messrs. W. Moss & Sons, Ltd., of Loughborough, for 13,436*l*., while the contract for constructing about 2,000 square yards of concrete floors has been given to the Yorkshire Hennebique Contracting Company. The estimated cost of the buildings was 18,000*l*., and furnishing 2,000*l*. The accepted tender was considerably less than the estimate, and at the Local Government Board inquiry the application for the loan was reduced by 1,500*l*. The Local Government Board had now given their sanction to a loan of 16,500*l*. on the buildings, and deferred the application so far as it related to furnishing. The period for repayment was thirty years.

The Rev. Canon A. S. Valpy, M.A., of the Close, Winchester, who left estate of the gross value of 216,000*l*., bequeathed 1,000*l*. to the Dean and Chapter of Winchester for the improvement or decoration of some part of the cathedral (less any sums expended by the testator upon the chapel in the north transept). 10,000*l*. to the Dean and Chapter of Winchester upon trust for a permanent capital endowment of which the income shall be applied for repairs or ornamentation of the fabric of Winchester Cathedral. 10,000*l*. to the Bishop of Winchester for the time being for building a church in that diocese, preference being given to the parishes of Aldershot and Farnborough. But by codicil, dated June 14 last, he stated:—"I fear that owing to the new Budget arrangements the legacy to the Bishop of Winchester, re the new Aldershot church or parish, will not be able to be paid. I, therefore, cancel that legacy, but I desire my executors, when the time for payment shall arrive, to pay such portion of it as they think they can do in fairness to other legacies."

"Arc" (Jeanne d') .	Sylvain Van Sintjan, at Brussels.

LUXEMBOURG.

Construction

"Tekton" . .	Württ. Tekton Werke, G.m.b.H., in Stuttgart.

THE PRACTICAL STERILISATION OF WATER AND OF SEWAGE EFFLUENTS.*

In the following paper it will be the author's object to deal with the practical sterilisation of sewage effluents and of water, as distinguished from the theoretical side of the question, which has been treated at great length by chemists and bacteriologists. It is for the chemist and bacteriologist to tell us of the need for sterilisation, of the best sterilising agents, and of the quantity and strength of sterilising agent required in each case; but it is for the engineer to find out how best to make the sterilising agent, and how best to apply it. It is his duty to make the process of sterilisation as effective, as simple, and as economical as possible. The chemist's training does not qualify him to deal with the details of the design, the construction and working of machinery, and seeing that his knowledge does not extend, in short, to the carrying out of engineering works, it is clear that such works cannot be carried out to the best advantage without the co-operation of both the engineer and the scientist. This fact has so often been overlooked in the past in sewage purification experiments that the author feels it needs emphasising in the present paper.

It may safely be said that the differences of opinion which exist between scientists are generally due to no fault in theory, but to considerable fault in the practical application of the theory.

As a practical illustration, one may imagine that at some remote period a great scientist discovered that a pint pot would contain a pint of liquid, but that his theoretical observations were not borne out in practice, owing to the fact that the pint pot in question was of such faulty construction that it allowed a large proportion of its contents to escape unobserved, for which cause other scientists came to the conclusion that the pint pot in question held a quart.

Evidence for and against Sterilisation.

It is not to be denied that hitherto most people in this country have regarded the idea of sterilisation of water or of sewage effluents with disfavour, and that eminent authorities

have declared it to be practically impossible. This feeling of prejudice is the more remarkable when one considers that the sterilisation of sewage effluents is practised in America and has been recommended by the Board of Agriculture of that country, while the sterilisation of water supplies has been adopted on an extensive scale at many places on the Continent and in America. Moreover, during the typhoid epidemic at Lincoln in 1905 the water supply of that city was actually sterilised with hypochlorite of sodium with most satisfactory results, and it is not to be doubted that many lives were thereby saved. The water being hopelessly polluted at the time, and no other supply being available, it is absolutely certain that nothing short of sterilisation could have rendered the water fit for consumption. A still more remarkable fact is that while the chemist and bacteriologist have done their best to prove the absolutely unsatisfactory condition of some of our most important sources of water supply, and have even gone so far as to state that no untreated water can be considered absolutely above suspicion from a bacteriological standpoint, and though they have pointed out that nothing short of sterilisation of sewage can protect the oyster-beds and fisheries round our coasts, they have with one or two exceptions condemned sterilisation in a whole-hearted manner. Thus, in Appendix VII. of the Fifth Report of the Royal Commission on Sewage Disposal, the opinions of the experts are all more or less to the effect that the sterilisation of sewage effluents is impracticable, and although these opinions were given as long ago as the year 1903, the Royal Commissioners appear to have based their opinions upon them. Dr. George Reid, in a paper read before the Royal Sanitary Institute at Stafford in the year 1907, condemned in a very decided manner sterilisation proposals set forward by Mr. W. Pollard Digby and the author, in a paper read before the Society of Engineers in 1906, which proposals were to the effect that sewage effluents discharged into tidal estuaries near shell-fish layings and into rivers like the Thames and the Lea, from which large supplies of drinking water must inevitably be drawn, should be sterilised, and that this could be done most economically by the use of electrolytic hypochlorite of sodium, and that the cost of this extra treatment ought not to come on the local authorities, but upon the authorities who draw their water supply from the river. These proposals, Dr. Reid stated, were condemned on general principles. He said "the question of sterilising sewage effluents has been the subject of more or less shadowy talk among public health experts for some time past; it is somewhat remarkable, seeing that the need for such a proceeding can only be justified on medical grounds, that the proposal is being pushed forward by engineering experts, while those medical experts, or the majority of them, who, up to the present, have publicly expressed their views, contend that the suggestion is impracticable." Dr. Reid is quite correct in stating that the opinion of the medical experts has, generally speaking, been to the effect that sterilisation of sewage effluents is impracticable. Professor Bostock Hill, for instance, at the same meeting, said that "instead of endeavouring to raise false standards of purity by going to the expense of sterilisation when the principle was wholly wrong, it was their duty to remove from the list of possible watersheds all those streams which received a large quantity of sewage." Thus, such rivers as the Thames, the Lea, and many others which form the only possible sources of water supply in many important cases, must be removed from the list of possible watersheds. This is, of course, a *reductio ad absurdum*, and merely serves to show the absolutely theoretical manner in which the scientist sometimes looks at these matters. The waterworks engineer and the municipal engineer know, however, only too well that even while such statements are being made, they must supply water of safe quality somehow, and do it immediately, or suffer the consequences. Dr. Reid, in his reply to the discussion on his paper already mentioned, said "the question was asked whether London should continue to drink sewage until some other supply was obtained; well, he was afraid it must, there was no other alternative."

It is interesting to compare the above very decided statements with those made by the U.S. Department of Agriculture, in Bulletin No. 115 of the Bureau of Plant Industry, which are as follows:—"Where sewage is rendering a water supply exceedingly dangerous, however, either the water must be disinfected before being distributed to the customers, or, according to what is the more logical first step in economic and æsthetic purification of the water, the polluting

sewage must be purified, and at least partially disinfected, before it is discharged into the stream or lake in question."

Again, the same report states that "It is desirable in many instances to remove from the sewage effluent bacteria which might be considered members of the pathogenic group. This is especially necessary when sewage is discharged in the vicinity of shell-fish beds, or when towns and cities are so intimately related that the standard methods of water purification cannot sufficiently protect one community from the sewage of another." This statement is followed by a description of certain sterilising agents, with costs of treatment from extensive experiments on a large scale which will be referred to later.

Messrs. Phelps and Carpenter, at the Massachusetts Institute of Technology, discussed the sterilisation of sewage effluents fully, and the paper was republished in the English *Sanitary Record*, January-March, 1907. Their conclusions were as follows:—"Ordinarily it is not the function of the sewage filter to remove bacteria from the sewage. In the case of the modern rapid filters we are not at all certain as to the fate of the dangerous germs of disease.

"Where extensive shell-fish interests are at stake, it will sooner or later become necessary to protect the neighbouring waters from pollution, and in this case the total absence of pathogenic bacteria must be assured. This result may be attained by the ultimate use of sand filters or by chemical sterilisation.

"Among the possible agents for use in sterilisation, chlorine, either as chloride of lime or as free gaseous chlorine, appears to have the highest cost efficiency. An amount of the former which will yield five parts per 1,000,000 of available chlorine was found to have destroyed 99.96 per cent. of the total bacteria, and practically all of the bacillus coli present in the effluent of a trickling filter treating crude Boston sewage, the time of contact having been two hours.

"The estimated cost of such treatment is $1.05 per 1,000,000 gallons of sewage." Messrs. Phelps and Carpenter add:—"The use of gaseous chlorine, manufactured at the disposal works by electrolytic methods, would, in the case of larger works, considerably reduce this cost. An approximate estimate places the cost of such treatment at about 85 cents per 1,000,000 gallons of sewage, allowing five parts of chlorine per 1,000,000. It is probable that the chlorine in this form is somewhat more efficient.

"The process, as thus outlined, is entirely feasible, and in the case of large works it is cheaper than sand filtration."

It is interesting to note that with regard to the efficiency of electrolytic hypochlorite, as compared with chloride of lime, Mr. Bertram Blount, in "Practical Electro-Chemistry," states that "one molecule of sodium hypochlorite (NaOCl) is equivalent in oxidising power to two atoms of chlorine" (pp. 26-27). This statement absolutely supports Messrs. Phelps and Carpenter's conclusions.

Sterilisation of Storm Water.

Of the objections raised to the sterilisation of sewage effluents, the only one of serious practical importance is that which relates to storm water. It has been urged that in times of storm a large quantity of sewage must necessarily pass into the rivers untreated from storm overflows—not only from overflows which take place at the sewage disposal works, but at overflows taking place from the sewers direct. Against this objection it must be first clearly understood that, even assuming that storm water must overflow from the sewers direct, there is no great difficulty in adding the sterilising agent to the liquid as it leaves the overflow. The sterilising agent has in any case to be added in very small quantities, and can be stored in a tank or in tanks, and discharged into the overflowing liquid by means of an automatic valve, which will add as much of the sterilising agent as is required to the volume of the flow This is an extreme case, and as a rule such overflows can be done away with, and the Fifth Report of the Royal Commission on Sewage Disposal distinctly advises the avoidance of overflows on branch sewers wherever possible. Where the storm water all runs to the disposal works, there is no great difficulty in treating the whole of it in the same manner as the ordinary effluent. This was actually done at Maidenhead over an extended period. It is quite as easy to add a small dose as a large dose, and as the Royal Commissioners have advised the use of tanks wherein the storm water may be stored for treatment, the difficulty vanishes altogether. There may remain the impression that an immense quantity of sterilis-

ing agent would be required in order to deal with a large volume of storm water, but it must be remembered that, although the rate of flow may, at times, be enormous, such rushes are not of long duration, and that taken over the whole year, the volume of storm water as compared with the volume of sewage is, after all, not very great. The Royal Commission report gives the following instances of the increase in the total volume of the sewage due to storm water:—

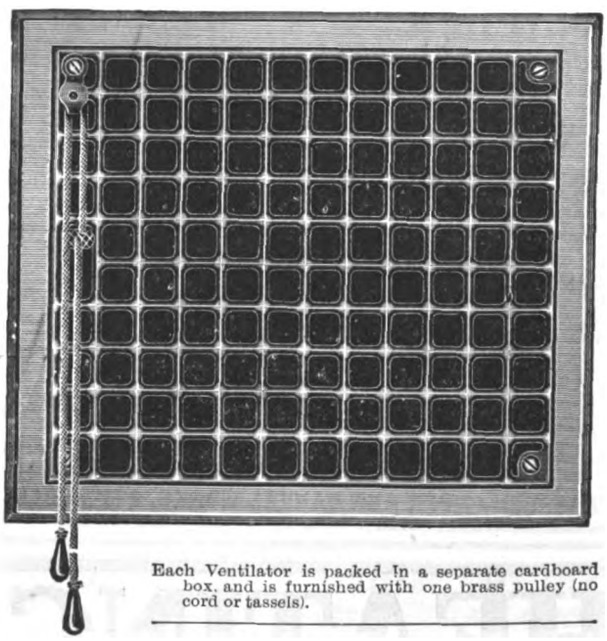
Pollution of Rivers above Waterworks Intakes.

In order to prove the impracticability of the proposals made in the Digby-Shenton paper, Dr. Reid assumed that a town of 10,000 inhabitants obtained its supply from a stream which, higher up, received the effluent from the sewage works of a city with a population of 50,000. This is exactly the reverse of the case in which sterilisation would be required. The cases where the sterilisation of sewage effluent is essential will be similar to the following instance observed by the author recently. A certain river forms the only possible supply of a large district served by a water company. The water has recently been found to be unsatisfactory in quality, but wells sunk at great expense have not yielded a supply sufficient to enable the water company to dispense with the river supply. The author observed a large sanatorium for consumptive patients on the banks of this river above the intakes, but within sight of the river's mouth. There were here and there other similar sources of pollution along its course. What doubt can exist that in this case the effluent passing to the river from the sanatorium ought to be sterilised? Many people would say it ought never to be permitted to go into the river at all, but it would be absolutely impossible to prevent the sewage from eventually finding its way into the natural drainage channel of the district, and it would be quite impossible to supply the district with water from any other source at the present time. The fact that this stream is polluted with drainage off the land and by many other smaller things is of small consequence beside the horrible pollution taking place from the sources already mentioned. In such cases, assuming that the scientists are correct, the only safe course to adopt must be to sterilise all sewage effluent entering the river, and also to sterilise the water drawn out of the river for drinking purposes. The same principle applies in larger cases. We have a city with a population of 6,000,000, which draws a large proportion of its water supply from the Thames, upon the banks of which is a population of, say, from 20,000 to 40,000 inhabitants. It is obvious that it would be a very small matter for the Metropolitan Water Board to see to it that no dangerous pollution of the river likely to cause disease in London should take place. On the river Lea the Water Board actually do sterilise the sewage of Hertford with chemical hypochlorite.

Where a new sewerage system is constructed, the volume of storm water can generally be reduced within reasonable limits. Where enormous quantities of clean water enter the sewers a proportion of the flow is generally due to subsoil water entering the system and to surface water being admitted, which might easily be taken to natural drainage channels for the district.

Sewage Discharged near Fisheries.

The need for the sterilisation of water and of se..... effluents entering the sources of water supply has been dealt with, but there remains the important case of sewage discharged in the vicinity of oyster-beds and fisheries.



It is needless to re-state the enormous amount of evidence which is at hand to prove that such contamination does take place with most serious results to the public health. The Royal Commission reports alone show that this is so, and the Royal Commissioners state that the only remedy is the removal of the oyster-beds or the removal of the sewage. They do not suggest any other remedy; but it is quite clear that the remedy suggested, if one can call it such, is quite impracticable. We have, in this country, a shell-fish industry, estimated by Captain Anderson, chairman of the Whitstable

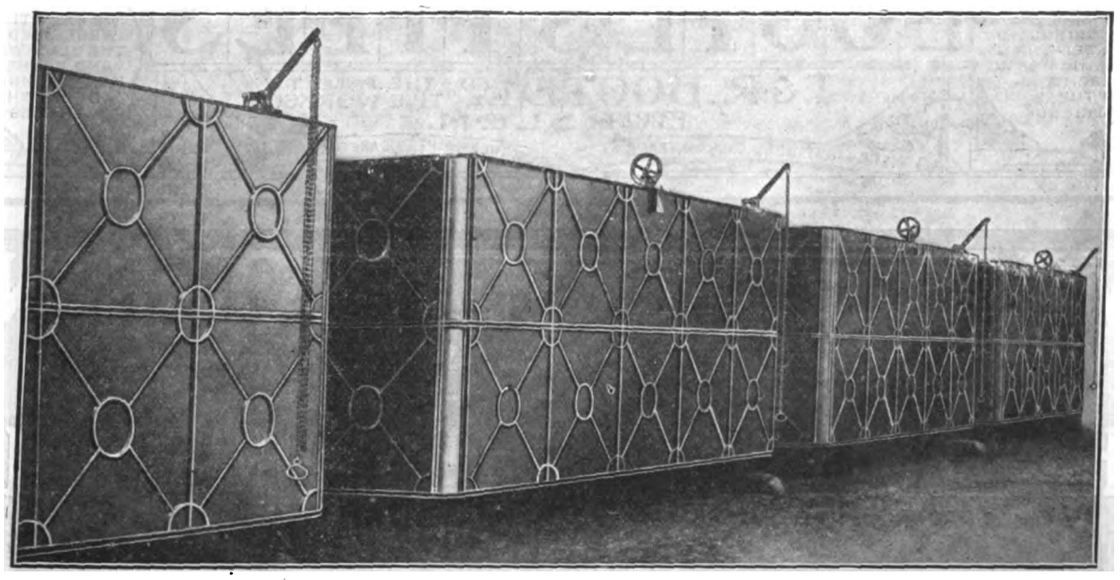
Company, to have a capital value of from 6,000,000*l.* to 8,000,000*l.* We have, on the other hand, a growing population round our coasts which must tend more and more to the pollution of the water in which the oysters exist. It is impossible to remove the population, and it is impossible to remove the shell-fish beds without destroying a valuable industry. On the other hand, it is quite clear that where a local authority does pollute oyster-beds or fisheries, they are liable to very serious penalties. Legal decisions in the cases of *Foster* v. *Warblington Urban District Council*, *Hobart* v. *Southend-on-Sea Corporation*, and *Owen* v. *the Faversham Corporation* have made this quite clear. The policy of shutting one's eyes to existing evils, however unpleasant, and living in a fool's paradise, cannot surely be the right way out of this difficulty. The author has no wish to contend that sterilisation is necessary at any particular place, but he does contend that unless the medical and scientific experts have raised an altogether unnecessary scare with regard to the pollution of drinking water, and to the pollution of oyster-beds and shell-fisheries, sterilisation must be required under given conditions, and that it is the only possible way out of the difficulty, always assuming that the difficulty exists.

Methods of Sterilisation.

Various methods have at different times been proposed for sterilisation. Heat, lime, acids, ozone, copper and its compounds, chlorine and its compounds, &c., have been proposed as agents, but at the present time there is a general agreement of opinion that chlorine is the most economical sterilising agent for sewage, while for the sterilisation of water ozone has been used at the majority of places. For sewage treatment chemically prepared hypochlorite in the form of bleaching powder or of chloride of lime has been largely used in America, while experiments have been made at Guildford, Maidenhead and elsewhere with hypochlorite of sodium prepared by electrolytic methods, which agent is now in common use as a disinfectant for various purposes.

For the sterilisation of water Dr. Rideal, in his paper read before the Royal Sanitary Institute on January 13 of the present year, pointed out that ozone is the ideal agent, since it leaves behind it only oxygen and nothing foreign to the water; but in the author's opinion there is much to be said in favour of hypochlorite of sodium, and especially for that produced by electrolytic methods. This agent is much cheaper, and unless the amount of organic matter present in the water is very large, it will have no unpleasant effect upon the liquid. It is difficult to see how ozone purification can compete with sterilisation by means of hypochlorite in the case of sewage effluents, but the ozone plant manufacturers are undertaking to do such work, and in view of further developments it is quite possible that both systems will be used.



Ozone Sterilisation.

In the paper read before the Royal Sanitary Institute upon the purification of water by ozone, by Dr. Rideal, attention was drawn to the fact that the Paris authorities are sterilising, or have decided to sterilise, a large proportion of their water supply. From this paper and from the discussion which followed it, it seems that about 20,000,000 gallons of water per diem are now to be sterilised by the ozone processes, as the result of experiments which have been carried on for a considerable period. This decision by the Paris authorities in favour of ozone is of great importance.

There are many patents which affect the various processes of ozone sterilisation, and it is necessary in comparing results obtained at various places to bear in mind the fact that one system may be more efficient than another, and that because system A. has failed to give satisfactory results at a certain town, it does not follow that system B. cannot produce a better and more economical result. There are patents and combinations of patents which certain companies or firms have acquired, or are acquiring.

The details of the Siemens De Frise process are given in Dr. Rideal's paper already referred to. Those of other systems are given in Mr. John Don's paper on the filtration and purification of water for public supply, read before the Institution of Mechanical Engineers this year, and in other papers of recent date. The author is indebted to the Lahmeyer Electrical Company for the following information:—

Digitized by Google

The Lahmeyer ozone process has been installed or is in course of erection at the following places:—

	Galls. per day
Paris Exhibition: Project voted and passed for treatment of	10,000,000
Nice: Installation erected, treating	5,200,000
Dinard: Treating an output of	528,000
Cosne: Treating an output of	528,000
Sulina: Treating an output of	330,000
Indret Ministry of Marine: Treating an output of	16,500
Chartres: Treating an output of	1,210,000
Armentières: Treating an output of	660,000
Dinard (second installation): Treating an output of	506,000
Avranches: Treating an output of	506,000

Projects have been voted at Villefranche, Beaulieu, St. Jean, Eze, La Turbie, Gabbe-Roquebrune, Menton, Monaco, and Monte Carlo, St. Servan, and installations for 5,720,000 gallons per day are in construction for these places already.

There are many small installations in use in this country at institutions, hotels, &c., many of them being in London. The ozonisers at Wiesbaden, Paderborn and Philadelphia are well known, much having already been written about them. The fact that the Paris municipality have, after continued experiment, decided to sterilise 20,000,000 gallons of water a day by ozone processes is in itself a sufficient proof of the great importance that sterilisation is assuming.

The author is also indebted to the Lahmeyer Electrical Company for the following figures:—

Allowing twenty gallons per head per day for a town of 50,000 people, a supply of 1,000,000 gallons per day could be sterilised at a capital outlay of 4,000*l.* This would include the whole of the electrical machinery, sterilising galleries and motive power (if necessary) where no local electrical supply is available. Should an electrical supply be available the annual cost of treatment would be lower. A population of 25,000, requiring 500,000 gallons per day, would entail an outlay, under the above conditions, of 3,500*l.* The cost per 10,000 gallons of water treated would be about 5*d.* to 7½*d.*, according to the local value of the kilowatt, which usually ranges from 1*d.* to 1½*d.* per kilowatt. The cost of treating 1,750,000 gallons per diem would be about 1,168*l.* per annum. This is inclusive of labour, repairs, rates, taxes, power, depreciation of plant and sinking funds, inclusive of interest at 6 per cent. on the capital outlay of 4,500*l.* The cost of treatment of 1,000 gallons in this case works out at ½*d.*

The cost of sterilisation of sewage by ozone is estimated as follows:—

For the treatment of 600,000 gallons per day: For supplying the whole of the machinery, inclusive of erection, 2,300*l.*

For the treatment of 1,250,000 gallons per day: In accordance with the particulars given above, 3,000*l.*

The above figures give an approximate idea of the cost of ozone sterilisation, but it is impossible to compare them exactly with the prices which follow without having further details as to the quality of the water sterilised, for it is certain that the cost of the treatment must vary in proportion to the quality of the liquid to be treated. In the case of sewage, the figures relate to a liquid containing 3 grains per gallon of solids.

(To be continued).

The number of new houses erected in Torquay during the last twelve months was 133, as compared with fifty-six two years before.

Arbitration proceedings took place recently in London with reference to the Leeds Corporation acquiring 600 acres of land, forming part of the Templenewsam Estate, for the purposes of their new sewage scheme. Mr. Thomas Oldroyd, the chairman of the Leeds sewage committee, has received information that the award of Lord Robert Cecil, K.C., M.P., who acted as umpire, with Mr. Henry Hartley, of Liverpool, as arbitrator for the Leeds Corporation, and Mr. John Farrar, of Oulton, as arbitrator for the Hon. Edward F. Lindley Wood, of Templenewsam, is for the payment by the Corporation for the land required of the sum of 149,644*l.* The claim of the owner was for 235,000*l.* It is estimated that the total cost of carrying out the new project will be about 1,250,000*l.*

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

TRADE NOTES.

THE British Uralate Co. (1908), Ltd., have so arranged their plant, which is supplied by a large engineering firm near London, as to produce 1,000 tiles per hour. Amongst the recent export contracts was one of 70,000 feet of their asbestos slate for a West Indian port.

THE Columbian Fireproofing Co., Ltd., have secured a 14,000*l.* contract for nearly five miles of high-pressure water-pipes, 24-inch diameter, on the "Bonna" system of reinforced concrete, for the Corporation of Swansea, under the general contractors, Messrs. J. Aird & Son. In addition to the above the Columbian Fireproofing Co., Ltd., are constructing the "Bonna" pipes, 18-inch diameter, for the Clydebank Water Trustees (19,000*l.*); also for the Belfast Corporation, 21-inch diameter (1,700*l.*).

"GLUICON" is, as its name suggests, an adhesive preparation made for cabinet, joinery and furniture makers, pianoforte manufacturers, parquet flooring firms, and other businesses who have to "stick on" at least as firmly as if they "nailed on." The Gluicon Manufacturing Company, 77 Mortimer Street, W., say that it will resist extreme heat or extreme damp equally well. It is prepared and used in the same way as ordinary glue, but it differs from it in its unusual strength. The material has found very considerable favour among the London and provincial firms who have employed it.

AMONG the stands in the "Women of All Nations" Exhibition at Olympia, which was opened on Wednesday and will close on September 28, is that of Messrs. Major & Co., Ltd., who are showing the artistic pavilion originally erected by them at the Letchworth Cottage Exhibition to illustrate the effect of their wood-preserving stain Solignum, which has been used on the interior and exterior woodwork. Solignum is a valuable preparation for the treatment of all woodwork; it is cheap, easily applied, has great covering capacity and is excellent in appearance. Of special interest is a case containing the result of a most severe test made with Solignum as a protection against the "white ant." Solignum has emerged completely successful.

FOR a firm to select as a motto the two words *Esto Perpetua* shows the possession of a degree of daring that might now seem little short of rash to any but the boldest minds, for these are days of such rapid change and unforeseen developments as to produce distrust of the future. Yet such enviable self-confidence seems to be well justified in at least one case, for the Carron Company, who bear that motto, can now look back on a century and a half of commercial enterprise and steady progress. In honour of that great event a pamphlet has been produced recording and illustrating the history of the company. The prime mover in its creation was Dr. John Roebuck, of Sheffield, an eminent scientist and mineralogist, who was the first to realise the mineral wealth of the district between the Forth and the Clyde. The erection of the works was commenced in 1759 on the north bank of the river Carron, and on January 1, 1760, amidst general congratulations, the first pig iron was produced. Since then the company has played a part in the national, artistic and commercial life of the nation of which it may well be proud, and has helped to build up the reputation honourably held by this country for distributing throughout the world manufactures that are second to none. The souvenir booklet conveys a good idea of the ramifications and achievements of the Carron Company in a hundred and fifty years. It would be unwise to prophesy, so we can only say of the company "Esto Perpetua."

THE American Consul at Port au Prince, Haiti, John B. Terres, reports that during the last three years the United States has lost its entire cement trade in Haiti. On inquiry as to the reason he was informed by merchants who formerly imported American cement that they had to abandon importations from the United States on account of the loss sustained owing to the bad condition of the barrels on arrival. These merchants now buy from Germany, England and Belgium. The European cement is packed in barrels lined with paper and hooped with iron, and arrives in good condition.

ROTHESAY School Board have agreed to abandon the scheme of erecting a new junior school within the grounds and to adopt the alternative scheme of a reconstruction and enlargement of the present Academy building. The plans provide for a large central hall from which access can be had direct to the various class-rooms, those in the upper storey entering from the balcony. The cost of the scheme is expected to approach 6,000*l.*

VARIETIES.

THE plans committee of the Aberdeen Town Council have approved the plans for the extension of the Aberdeen Royal Infirmary. The value of the work is about 11,000*l.*

THE Lancashire Asylums Board have authorised the committee of visitors at Prestwich Asylum to prepare plans and estimates for the approval of the Board for an infirmary to accommodate 100 female patients, and for two villa blocks to provide separate accommodation for fifty private patients of each sex.

ACCORDING to *Kemp's Mercantile Gazette*, the total number of commercial failures recorded in England and Wales during the week ending Friday, August 27, was 124. There were thirteen failures in the building trades, as against eleven in the corresponding week in 1908 and twenty-three in 1907.

THE North Dublin Rural District Council have recently adopted a scheme under the Labourers' Acts which has been postponed from time to time for the last two months. Mr. Morris, clerk of works and architect, estimated the cost of the scheme at 19,278*l.*, and it provides for the erection of ninety-seven new cottages and fourteen additional allotments. There are 550 cottages already erected in the Union.

THE substantial and picturesque new bridge over the river Wey at Guildford was formally opened on the 25th ult. It was erected from the designs of Messrs. Clemence & Moon, architects, Guildford, with Messrs. Henry Adams & Son, of 60 Queen Victoria Street, E.C., acting as consulting engineers. The cost was defrayed by public subscription.

THE directors of the Fife Coal Company have had before them recently plans for the erection of a large number of workmen's houses at Valleyfield, where they are sinking two of the largest pits in Scotland. It is expected that the pits will give employment to between 1,500 and 2,000 men when completed two years hence, and provision will require to be made for the greater number.

"ENGINEERING Day," under the presidency of the Lord Mayor of London, will be held at the Imperial International Exhibition, White City, to-morrow (Saturday). Over 20,000 invitations have been sent out to leading mining and other engineers of the country, and a large gathering of influential gentlemen is expected. There will be a series of special demonstrations in the Machinery Hall and of lectures in the Congress Hall.

THE report of the Philadelphia Bureau of Building Inspection for July shows that the value of the work for which permits were issued during the month was $985,110 in excess of the value of the construction begun in July, 1908. The permits granted last month covered 1,541 operations costing $3,897,590, against 1,298 operations costing $2,912,480 in July of last year. Taking the total value of the work done during the current year to the end of July we find it to be $25,792,340, spread over 10,956 operations, compared with $16,679,990 and 7,908 operations for the corresponding period of 1908.

THE Newcastle Board of Guardians considered on Friday plans for extensions and additions at the cottage homes, involving an estimated expenditure of about 11,700*l.* The scheme included the extension of the school at a cost of 3,750*l.*; extension of the homes by one double block to accommodate thirty children, 2,800*l.*; erection of a sick and isolation cottage and doctor's dispensary, with accommodation for thirty-nine beds, 3,790*l.*; and 415*l.* for road-making. The scheme was, after discussion, deferred for final consideration for a fortnight.

A SPECIAL meeting of the Llandrindod Wells Urban District Council was held last week to consider a letter from the Local Government Board relative to their application for a loan of 10,000*l.* for the erection of a pavilion in the recreation ground. The Local Government Board wrote stating that whilst they saw no objection to the erection of a pavilion, they could not sanction a loan of 10,000*l.* for the purpose, and the Council were asked to reconsider the proposals. The Chairman reported that he had had an interview with Mr. John Burns, M.P., on the subject. Mr. Burns had insisted on the reduction of the scheme to a cost of about 5,000*l.* The design is to be modified accordingly.

AT a recent meeting of the Dundee Housing and Town Planning Committee a report submitted by Mr. Walsh and the City Engineer in reference to their attendance as delegates at the National Town Planning Congress was considered. The report stated that the information gained

from papers, discussions, and inspections would prove of value when the Town Council proceeded to consider the working of the Housing and Town Planning Act, or to formulate any scheme of town planning or of housing for Dundee. Keeping Dundee and the local situation always in mind, the delegates were confirmed in their belief that few cities more required, or could more quickly profit by, improved housing and town planning. The Congress gave the impression that a new day was dawning, and that municipalities would be able to engage in measures for improvement far more hopefully than hitherto. In their visits to various places the delegates were impressed by the large areas devoted to open spaces, and especially noted the accommodation provided in houses varying in cost from 200*l.* to 350*l.*, and they were satisfied that if suitable ground could be acquired a commencement might be made on a well-arranged plan with houses of about ten to the acre; and towards that end it was suggested that the Council be shortly asked to consider as to acquiring a suitable portion of property in an accessible district at a reasonable price.

A GREAT cement combine is, as we stated last week, being formed in Canada by the amalgamation of a number of cement manufacturers. According to the *Glasgow Herald*, the new company is called the Canadian Consolidated Cement Company. It will include all the large plants in the Dominion, and it will have a capital of $25,000,000. The consumption of cement in Canada last year was 3,134,358 barrels, an increase over the previous year of 25,615 barrels. The production of cement in Canada in the same year was 3,495,961 barrels of 350 lb. each. This was an increase on the previous year of 1,004,448 barrels. The increase in production last year was thus much greater than the increase in consumption, and the capacity of the plants is for greater increase still. There are now twenty-three cement factories, and the capacity of these is 27,100 barrels per day, which is equal to 8,250,000 barrels per annum, or three times the present consumption. Then there are imports, which last year were to the value of $800,000.

A SHORT article appeared in these columns on August 13 relative to the advantages of Fishguard as a port of call for the Transatlantic liners. Everything then said has been abundantly justified by the record created by the arrival of the *Mauretania* at the Pembrokeshire port on Monday. London is now six hours nearer New York than it was a week ago, and the journey from the capital of the United States to the metropolis of the British Empire comes well within the limit of five days. Both the Great Western Railway and Cunard steamship company are entitled to the congratulations of both countries. The railway company will now reap the full benefit of their foresight and enterprise which led them to undertake the construction of a magnificent harbour at Fishguard—a work that is not yet complete. Exactly three years previous to the arrival of the *Mauretania* the Fishguard-Rosslare route to Ireland was inaugurated, and this has been ever since used by a steadily increasing number of tourists. There is no need to mention here the admirable organisation of the Great Western Company, which enabled the passengers, mails and baggage to be transferred from the *Mauretania* and despatched to their destinations in record time, for this was fully described in the London and provincial newspapers of Tuesday last. It should be mentioned that Brunel foresaw the possibilities of Fishguard, but he was prohibited from proving them by the engineering difficulties.

LONDON TRADE SCHOOLS.

AMONG the papers read at the meeting of the British Association was one by C. W. Kimmins, M.A., D.Sc., dealing with London Trade Schools. In the course of his remarks the lecturer said the problem of problems in London and elsewhere is to prevent children of fourteen years of age drifting into unskilled labour in which there is no element of permanence. The difficulty is increased by the decay and gradual disappearance of the apprenticeship system and the altered conditions of employment in workshops which make them unsuitable places for the training of craftsmen.

An elaborate scheme of junior intermediate and senior scholarships established by the London County Council makes ample provision for the brilliant children of the London elementary schools. The really capable child, even of the poorest parents, may reach the highest position by

means of the scholarship ladder, passing at the age of eleven years into the secondary school, and thence by means of scholarships at the age of nineteen to the University or higher technical school. Provision is also made for the transference of children who do not reach scholarship standard to pass on to a higher form of elementary school in which a special bias may be given in training for commercial or industrial life in a course of instruction extending for a year or two beyond the age of compulsory attendance.

The trade school, however, is of a very special type for children who have to enter upon their life's work at the age of sixteen or seventeen, and who have already decided upon the trade they wish to enter. The age of entry into the trade school coincides aproximately with that at which the boy or girl normally leaves the elementary school, viz. thirteen or fourteen years of age, and the course of instruction lasts for two or three years.

In London the boy or girl of fourteen who is physically strong and has received a fairly good education, has no difficulty whatever in obtaining employment at a rate of remuneration which appears liberal for a child of this age. The consequence is that in the elementary school the vast majority of the children leave immediately they reach the age of fourteen and become wage-earners. In order to keep children at school above the compulsory age for any definite period it is absolutely necessary not only to give them free education, but, in addition, maintenance scholarships which will recoup the parents to a certain extent for the loss of the earnings of the children.

The scholarships for trade schools for boys extending over a period of three years are generally of the value of 6*l.* for the first year, 10*l.* for the second, and 15*l.* for the third year. The trade schools for girls generally have a two years' course, and the value of the scholarships is 8*l.* for the first and 12*l.* for the second year. Unsuccessful candidates who do not obtain scholarships may be awarded free places. For other pupils a low fee of generally 10s. a term is charged.

No candidate is eligible for a scholarship whose parents or guardians have an income which exceeds 160*l.* a year from all sources.

The special features of the London Trade Schools are:—

1. The assistance given in the direction of the trade teaching by consultative committees of business men and women engaged in the particular trades for the training in which the school provides.

2. The appointment of after-care committees, the members of which interest themselves in the scholars and advise them with regard to employment at the conclusion of the school course, and afterwards see that the conditions of their employment are satisfactory.

3. The continuance of the general education of the pupils, only about one-half to two-thirds of the school time being given to actual workshop instruction.

4. The prominence given to art instruction, not only in the technical requirements for the particular trade, but for the general development of a high standard of taste.

5. The employment of teachers who have attained distinction as practical workers, and who approximate the instruction as far as possible to workshop conditions.

6. The holding of exhibitions of students' work to which employers are invited and at which offers are frequently made for the employment of students.

Trade schools for boys have been established in engineering, silversmithing, bookbinding, furniture and cabinet making, carriage building, art woodcarving, and various branches of the building trades. The trades for which schools have been established for girls are trade dressmaking, laundry work, upholstery, ladies' tailoring, waistcoat making, corset making, millinery, designing and making of ready-made clothing, and photography.

The development of trade schools in London is proceeding rapidly. The competition for the scholarships is becoming keener every year, and the work of the students is finding increasing favour with employers. No difficulty is experienced in finding suitable employment for boys and girls who have passed through the schools successfully.

BUILDING AND BUILDERS.

FURTHER improvements are to be undertaken at the York racecourse, including the reconstruction of the 5*s.* ring and roofing of the enclosure.

THE Birkenhead Town Council have accepted the tender of Mr. P. Rothwell, of Birkenhead, for the erection of a school in Brassey Street. A loan of 17,306*l.* is to be raised for the purpose.

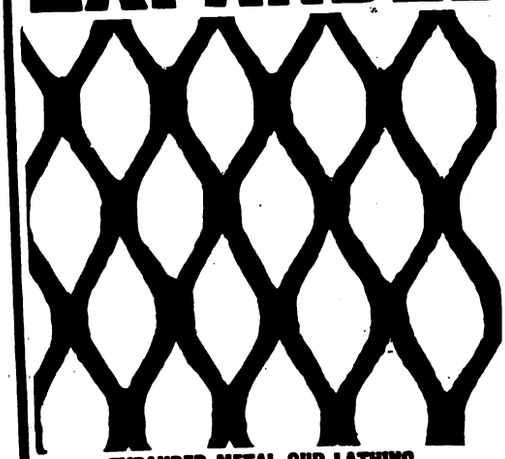
A FIRM of Glasgow builders are in negotiation with Lord Elgin for fifteen acres of land for feuing purposes near Dunfermline Corporation gasworks immediately to the south of the town. There is at present a great scarcity of houses in Dunfermline and district.

THE Bootle Town Council have just approved the plans and estimates of the proposed construction of a new road called Northfield North, at an estimated cost of 6,290*l.*, together with 325*l.* for filling up the land, and in connection with it the widening and reconstruction of Linacre Lane and Moss Lane at an estimated cost of 5,360*l.*

THE ancient tithe barn, first erected in the year 1306, and belonging to the Abbey of Peterborough, was pulled down at Peterborough some years ago and the materials purchased by Mr. Fox, F.S.A., of London, who has now offered them to the Peterborough Town Council, with a view to their re-erection on another site. The building was 40 feet high, 80 feet long, and 32 feet wide. The Council will give a reply in about a fortnight.

THE Bakewell Urban Council have abandoned their scheme for the erection of baths and pump-room. The proposal first came up twelve years ago, and on Tuesday a tender amounting to 3,200*l.* was recommended for acceptance which had been submitted by one of the members, who resigned his seat on the Council prior to the tenders for the baths being opened. The scheme was abandoned on the chairman's casting vote last Wednesday.

A MEETING of the Sugar Beet Growers' Syndicate of England was held at Sleaford on Wednesday, Major W. V. R. Fane, of Fulbeck Hall, presiding. It was announced that contracts had been signed for the requisite acreage of land in the county for growing the beet, and it was resolved to proceed with the erection of the proposed factory at Sleaford. The capital of the company is 100,000*l.* Arrangements were made for the appointment of a consulting engineer.



THE Liverpool City Council on Wednesday decided, after considering the report of Mr. J. T. Alexander, city building surveyor, that "while recognising the desirability of having a bath fixed in every house, they do not see their way to recommend that powers should be sought to make it compulsory to provide a bath in every dwelling-house." It was at the same meeting agreed to apply to the Local Government Board for sanction to borrow 12,500*l.* to enable "three chapels to be erected in the Allerton Cemetery, such chapels to be erected upon parts of the ground which are not consecrated or set apart for the exclusive use of any particular denomination, and not to be consecrated or reserved."

AT Bentley an inquiry was held on Wednesday by Mr. E. A. Sandford Fawcett, M.I.C.E., on behalf of the Local Government Board, into an application by the Doncaster Rural District Council for power to borrow an additional 3,000*l.* for sewage disposal work in the parish of Bentley-with-Arksey. Mr. Balfour, of the firm of Messrs. Balfour & Sons, the engineers, said that the original scheme, for which application had been made to borrow 3,400*l.*, was for the drainage of 200 houses to be put up by the Bentley Colliery Company and the drainage of Rostholme. Further developments had since taken place, and plans had been submitted by the colliery company for many more houses, 776 in all, which, together with 200 other houses in course of erection and proposed to be erected in the area, made practically 1,000. The scheme provided for the drainage of 1,300 houses. Several of these houses have been already built, but without a proper system of drainage.

THE Guatemalan Legislature have decided to build a new opera house on modern lines having a seating capacity for 2,500 persons.

THE decision of the Board of Trade arbitrator in the Swansea painting trade dispute was delivered on Tuesday. The men's demand for an extra halfpenny per hour has not been conceded. The men are, however, granted overtime at the rate of a halfpenny per hour increase betwen five and seven in the evening.

A NEW HYGIENIC SCREEN.

THE hygienic screen now being put on the market by Mr. J. S. Morriss is most simple in design, in construction, and in mode of application to existing windows, doors or other apertures, and its advantages are at once apparent to all who realise that pure air and direct rays of sunshine are the two principal essentials to healthy life. These are freely admitted, without draught, but all dust, flies, or other insects are rigidly excluded. It is an unequalled boon to all sorts and conditions of men both in the home and at business. It meets the present all-pervading demand for pure air, and plenty of it, without the inconvenience and the peril attaching to the admission of dust, flies and microbes, hence to the sanatorium, the hospital, and the operating-room it is indispensable. In the home fresh and pure air can be safely introduced to the bedroom, the dining-room, and the boudoir with equal facility, whilst for the smoke-room its merits are equally obvious. The larder can be made into a complete safe, and all therein perfectly protected from the ravages and disease-carrying properties of the house fly. The greenhouse can be equally well freed from the admission of the green fly and other pests, whilst sunlight and fresh air are admitted without stint. Business offices are freed from the nuisance of the street filth which necessarily enters the open window. At the same time the new hygienic screen breaks the rush of air, hence the nuisance of papers blowing about

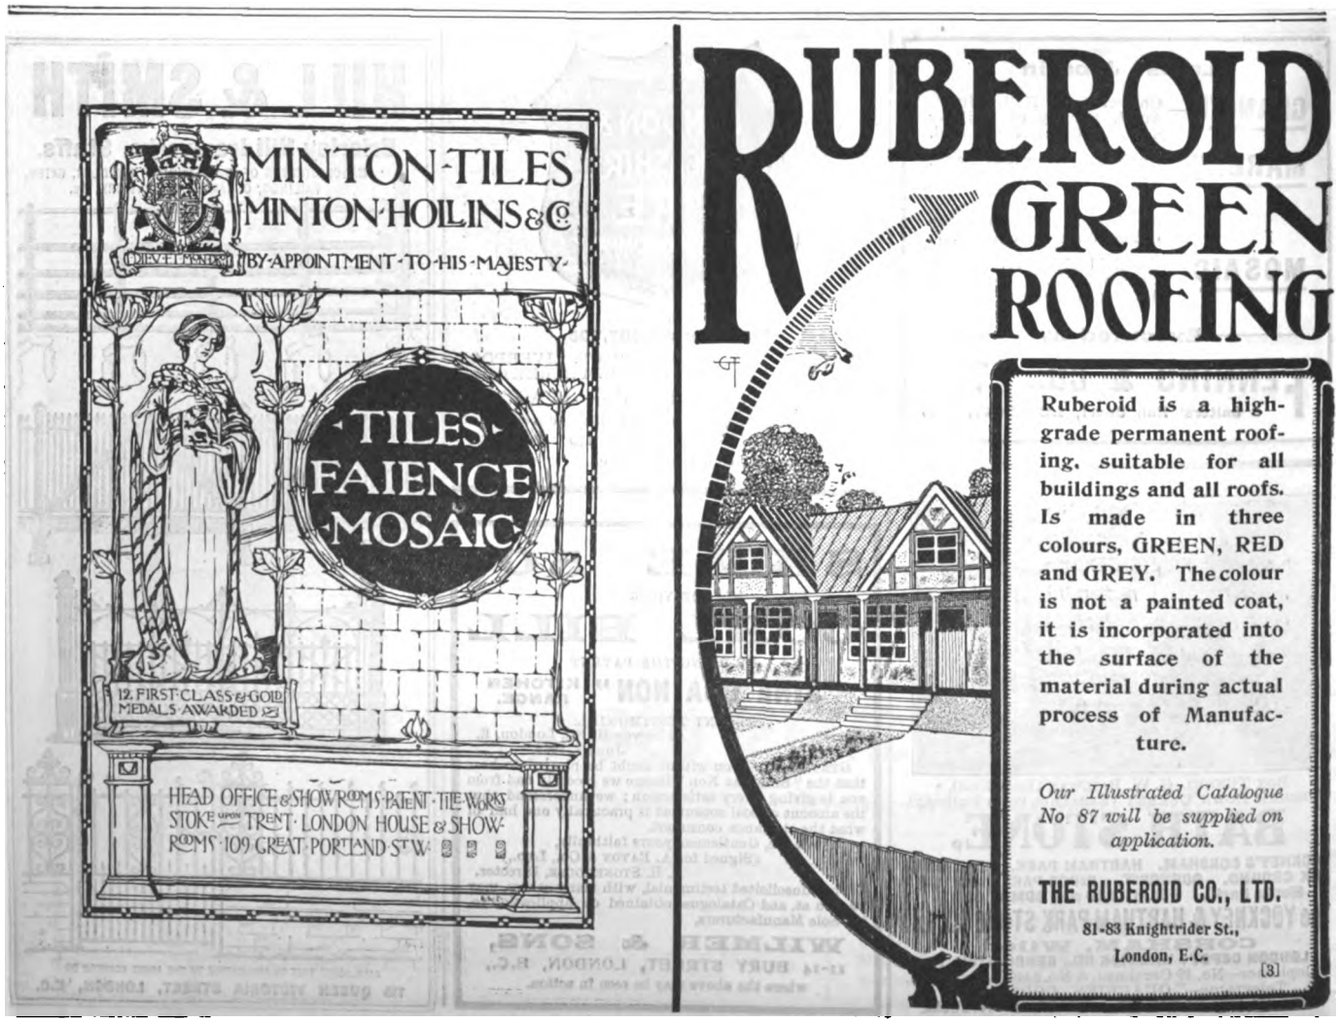
and becoming disarranged is not experienced. Fine goods show-rooms, where ventilation is so necessary, are freed from the value-destroying "blacks" which accompany all attempts at ventilation where the new hygienic screen is not affixed. Provision shops, confectioners, dairies, and other



FITTED TO SLIDING DOOR.

similar business concerns can present their goods to the full view of the public, and at the same time have that delightful current of fresh air which preserves their goods and greatly benefits the consumer and customer. Hotels, public rooms, and similar places where large numbers congregate will find the instalment of the new hygienic screen of great benefit. In the tropics and other places where the mosquito holds sway the new hygienic screen will be looked upon as an unexampled blessing. A variant on the hygienic screen is obtained by the substitution of an opaque material for the gauze by which all light is excluded and the chamber made perfectly dark. This will be of great advantage to the amateur photographer who, at very slight expense, can immediately transform his bath-room or any other room into a perfect dark room, or by the substitution of other materials of the necessary colour into a toning-room. This form will also be welcomed by all lecture-rooms and other places where the dissolving view or limelight apparatus is used in the daytime.

The principle of the new hygienic screen is also admirably adapted for use with the ordinary window blind, that is to say, the sides of the blinds are engaged in the side slots, which are fitted down the whole of each side of the window to which the blind is attached. This secures a perfectly flat surface to the blind when drawn down without the "billying" or flapping which is so annoying in the ordinary blind when a wind is blowing. For roofs of greenhouses, photographic studios, markets, and other large buildings with glass roofs the use of this frame secures the blind lying quite flat against the roof and thus preventing dust settling on top of the blind, consequently the blind, which is operated by cords in the ordinary manner, may remain drawn for any period, and when it is allowed to recede into its case there is no fear of dust falling and so spoiling any goods which may be on view in the market or other place. The slight extra cost of the roller blind should be no preventative to a large trade being done, the advantages being so obvious.

IN a large majority of cases the underground rooms in Marylebone are believed to be occupied in contravention of the provisions of the Public Health (London) Act, 1891, but, says the local medical officer of health, "it is utterly useless to attempt to deal with these on the strict lines of the Act, for, even supposing that the staff of inspectors were sufficient to discover all those illegally occupied, the enforcement of notices to quit or to occupy the underground room only in conjunction with a room on the upper floor would involve the displacement of hundreds of families who literally cannot find accommodation such as they require at a rent that they can afford."

THE PRACTICAL STERILISATION OF WATER AND OF SEWAGE EFFLUENTS.*

(Continued from last week.)

Hypochlorite Sterilisation for Water.

THE sterilisation of drinking water by means of hypochlorite is obviously possible, and seeing that the cost of the treatment and of the plant itself would be so very much less than in the case of ozone, it surely is the duty of any person who has the installation of sterilising plant for a town supply under consideration to make a thorough investigation as to the possibilities. If it was possible to sterilise the water supply of the city of Lincoln for an extended period with chemically prepared hypochlorite administered in very strong doses, the water being of very bad quality, with a large amount of suspended matter in it to give trouble, it must surely be possible to obtain a very much better result with electrolytic hypochlorite, which is much more active. At any rate, in cases where the water to be treated contains a very small quantity of organic matter, there can be no doubt that with the small quantity of available chlorine that would be required it would be quite impossible to detect any change in the taste or appearance of the water. Seeing also how easy it would be to carry out an experiment, owing to the fact that the sterilising agent can be carried from place to place in an ordinary bottle, it is quite a simple matter for anyone to make an experiment with any particular water in order to ascertain the exact effect of such treatment. There are a large number of places in this country which could be supplied with water at comparatively small cost, provided that water could be efficiently purified, and there are a large number of places where at the present time water of questionable quality is being consumed.

It is unreasonable to pretend that the presence of, say, 1 or 2 parts per 1,000,000 of available chlorine could possibly affect the taste of the water. An unpleasant taste could only result in cases where the water contained a large quantity of suspended matter and required treatment with a much larger proportion of chlorine.

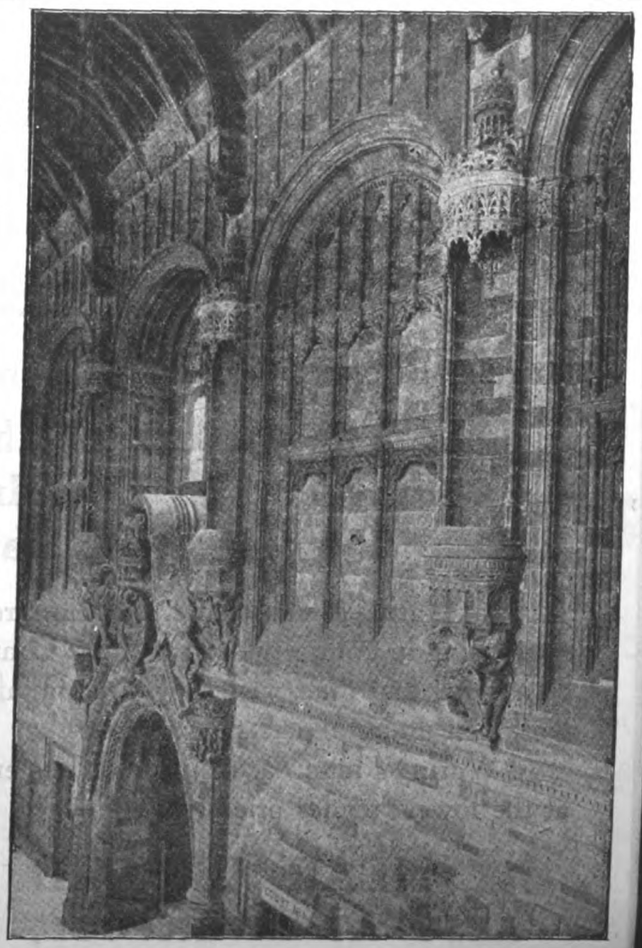
* A paper read at the Building Trades Exhibition by H. C. H. Shenton, M.S.E.

Chlorine Sterilisation.

There are several electrolysers for the production of hypochlorites. Roughly, the method of preparation is as follows:—A solution of common salt—i.e., sodium chloride—is prepared and through this an electrical current is sent, with the result that the sodium chloride is split up into its component parts of sodium and chlorine. The chlorine is liberated at the electrode connected to the positive pole of the source of the electricity supply, and the sodium is also liberated at the electrode connected to the negative terminal. Chemists are not wholly agreed as to the exact detail of what takes place, but, for practical purposes, it may be said that the sodium and chlorine recombine with one part of oxygen to form hypochlorite, in which the chlorine is in a particularly active condition, and that this liquid contains a quantity of free chlorine and oxygen, and that it is valuable as a sterilising agent in contact with organic matters: the oxygen present in the hypochlorite is liberated. Very minute quantities of the hypochlorite have to be used, and after the work of sterilisation is effected and the oxygen released, the available chlorine reverts to its inert form of sodium chloride.

Dr. Rideal, who has applied solutions from the Digby electrolyser to the treatment of tap and lake water for the elimination of algæ and confervoid growth, said, in a paper read at the Bristol meeting of the Royal Sanitary Institute:—"This solution, besides having the advantage of cheapness, contains but little undecomposed sodium chloride, and consequently the final addition of chloride to the treated water is very small." In the case of tap water treated for conferva, "practically the only alteration in the chemical analysis is a reduction of the oxygen consumed figure, and an increase of the chloride from 2.1 to 2.4 parts per 100,000."

Hermite.



In a paper read before the Faraday Society in 1906 Mr. Charles V. Biggs described the Hermite plant installed by Dr. Alexander and in use at Poplar, and as this gives prices it is of particular interest. The total space occupied by the electrolysing plant, including the tank, is 7 feet by 7 feet. The capacity of the tank is about 215 gallons; the total headroom is 10 feet. During a run of eight hours, 108 gallons of hypochlorite solution, at a strength of over 4 grammes per

litre (i.e., a 0.4 per cent. solution), are made. The tank is charged by placing in it 100 litres of a saturated solution of sodium chloride and 20 litres of a saturated solution of magnesium chloride. To this is added as much water as is needed to bring the whole quantity up to 840 litres (185 gallons). The liquid flows from a pipe in the bottom of a tank, at the end of which is a ball valve, into a small flushing cistern at the side, in order to obtain an even flow; otherwise, as the tank emptied the flow would be slower. Thence it flows through another pipe into a funnel leading to the first row of cells. The second pipe mentioned has a cock for regulating the flow. The flow adopted is 3⅓ pints (1.9 litres) per minute. This works out at 25 gallons (103.5 litres) per hour, or about 185 gallons (840 litres) in eight hours. The plant is designed to work at 15 ampères and a flow of 1.9 litres per minute. The manufacture of the hypochlorite solutions is carried on by a process which is practically automatic. For an output of 200 gallons per eight hours at 4 grammes per litre (a 0.4 per cent. solution) the capital cost, including buildings and fittings, would be about 500*l*. With regard to running costs, the sodium chloride at 40*s*. per ton, magnesium chloride at 5*l*. per ton, 185 gallons of hypochlorite can be produced for 9*s*.—that is to say, 1*s*. 6*d*. for salt, 1*s*. for magnesium chloride, 2*s*. 6*d*. for electric current, and 4*s*. for attendance and labour. Seeing that 185 gallons of a 0.4 per cent. solution of hypochlorite would contain 3.37 kilogrammes of available chlorine, this plant produces sufficient hypochlorite to sterilise 180,000 gallons per diem, allowing four parts per 1,000,000 of available chlorine. The liquid thus produced is used at Poplar for disinfecting purposes, such as road-watering. It should be observed that the objection formerly urged against this process, that the product was unstable, does not now hold. Such a plant as this would apparently serve a town with a population of 6,000.

Oxychlorides.

Dr. Rideal, in a paper read recently before the Faraday Society, described the oxychlorides process in use at Guildford. In this paper the results of very important experiments were given. It is to be noted that prices were not given in this paper, but there is enough evidence as to the approximate cost of the production of electrolytic hypochlorite for anyone interested in the subject to come to some conclusion as to the cost of carrying out works similar to those recommended by Dr. Rideal. The first series of experiments made by Dr. Rideal in 1904 showed the efficiency of electrolytic hypochlorite as an oxidiser, deodoriser or germicide of sewages and effluents. Early experiments proved that if one part per 100,000 of available chlorine were added at the inlet of a branch pipe through which septic effluent were passing, at the rate of 1,000 gallons per hour, the pipe being 40 feet long and 2½-inch bore, the liquid would be deodorised in passing through the pipe. "At the commencement a strong foul odour existed at the receiving chamber. The liquid was deodorised in passing through the pipe, and in less than an hour the whole tank had lost its odour." A large number of other experiments showed, first, that it was possible to deodorise septic tank effluent without in any way interfering with subsequent filtration. It might have been expected that a sterilising agent would have affected the bacteria in the filter-beds so as to lessen their action, but this was not found to be the case, even though very strong mixtures of hypochlorite and sewage were discharged on to the filter. The possibility of thus deodorising sewage or killing the harmful germs in it by means of a sterilising agent without interfering with subsequent filtration is a very important fact, for it is well-known that the nuisance from septic tank effluents discharged on to filters is very great at many places, and in some cases, especially where brewery refuse is present in the sewage, it would be very beneficial if something could be done to do away with this nuisance. But a much more important fact was ascertained in these experiments—viz., that by the addition of hypochlorite to the tank effluent, clogging growths can be dissolved and washed speedily from filters. It was also found that an addition of strong hypochlorite would prevent the sprinkler from becoming clogged with growths, and it was also established that filters that have been thus treated quickly recover under normal conditions. It was proved that a filter can be successfully matured when hypochlorite is used in such quantities as are required for preventing aërial nuisance, and it even appeared that a bed could be thus matured at a quicker rate than with untreated tank liquor.

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

Ohio Experiments—Chlorine and Copper Sulphate.

The investigations of Kellerman, Pratt and Kimberley, for the Ohio State Board (United States Department of Agriculture, Bulletin No. 115, October, 1907), give economical results obtained with a solution of chloride of lime, and these investigators, together with Messrs. Phelps and Carpenter, already quoted, appear to have no doubt that more economical results are to be obtained by the use of hypochlorite produced by electrolytic methods, and it is to be hoped that the Ohio State Board will supplement these experiments with others, carried out with electrolytic hypochlorite. The experiments mentioned in the Ohio State report are of such interest that a brief summary with extracts in the present paper will not be misplaced. Copper sulphate experiments were made before the chlorine experiments, and it was clearly established that chlorine, even in the chemical form, was very much more economical than copper sulphate.

Copper Sulphate Experiments.

At St. Mary's of the Springs sewage from a school was treated, the population being about 175 persons. The sewage is discharged into two tanks operated in series. The tanks are 10 feet in diameter and 6 feet deep, the capacity of each being 3,050 gallons. The flow of sewage is about 12,000 gallons per diem; the sewage discharges from the second tank into a small brook. Dating from September, 1905, it has been the daily practice of the health department of the city of Columbus, Ohio, to apply copper sulphate to the sewage at the inlet of the second tank, the quantity of copper sulphate added daily being 6 lb., 3 lb. of which are introduced at 9 a.m. and the remainder at 3 p.m., roughly approximating to a concentration of 63 parts per 1,000,000. The copper sulphate in a dry state is placed in a perforated enamelled pail, which is lowered into the liquid at a point opposite the discharge pipe from the first reservoir The copper sulphate remains here and is dissolved by incoming sewage. The treatment removed from 98.98 to 98.99 per cent. of the bacteria. With copper sulphate 6 cents a pound, and a daily sewage flow of 12,000 gallons, the expenditure for chemicals is 3 cents (1½*d.*) per 1,000 gallons; the labour cost is 25 cents (1*s.* 0½*d.*) per day; the annual cost of treatment equals $222.65 (44*l.* 10*s.*), representing an investment of $4,500 (900*l.*). This is distinctly a high price to pay for sterilising the sewage, but, on the other hand, it must be remembered that the treatment is reduced to a minimum, and that poison from pathogenic germs is entirely prevented. Such treatment might be very useful in the case of a private house or institution polluting a river used for drinking-water purposes, and would, according to scientific data, be very much more efficient in preventing the possibility of disease than a much more elaborate system of filters. However, the idea of permitting even sterilised sewage to go into a stream is very objectionable, and there can be no doubt that it would be better to incur the cost of filtration works, and to pay less for the sterilisation, seeing that a filter effluent could be sterilised at a much lower rate.

At Westerville, Ohio, the sewage plant comprises two small septic tanks, which discharge through an aërating device on to six primary contact filters, which in turn discharge on to two secondary filters. The plant, at the time the experiments were carried out, was operated continuously instead of upon the contact principle, which may account for the high rate of cost. The computed discharge is 41,000 gallons in twenty-four hours. "Copper crystals were dissolved in barrels connected in series. The solution in the barrels was conducted to an orifice box where, by means of a ballcock, a constant head was maintained upon an adjustable orifice. The quantity of copper sulphate used in each test was based upon the computed flow of 41,000 gallons of effluent in twenty-four hours." After passing through the orifice box the copper solution was discharged into a small storage reservoir at the same point where the discharge from the sewage effluent orifice box was admitted; the rate of discharge was 0.5 gallon per minute. At the point of entrance of the sewage effluent and the copper solution there was placed a small longitudinal baffle, serving to effect a thorough mixture of the chemical and the effluent. The storage period, or time of contact of sewage and copper sulphate, was slightly over one hour. On a basis of treating daily 41,000 gallons of effluent from the primary contact filters, the initial cost of the plant would be about $70 (14*l.*). The cost of the chemicals would be about 82 cents (3*s.* 5*d.*), and the cost of labour about 50 cents (2*s.* 1*d.*) per diem. The

annual cost with copper sulphate at 6 cents (3*d.*) a pound, and labour 25 cents (1*s.* 0½*d.*) an hour, would be $482.5 (96*l.* 10*s.*); capitalised at 5 per cent this would represent an investment of $9,650 (1,930*l.*).

At the Boys' Industrial School, a State institution at Lancaster, Ohio, with a population of 1,100 persons, the sewage is treated on twenty-three sand filters, which receive screened crude sewage. The sewage flow averages about 160,000 gallons in twenty-four hours. At the outlet of the effluent drain a weir was constructed, having a length of 1 foot and a height of 15 inches. Over this the sewage effluent was caused to flow. Suitable means were provided for observing the elevation of water on the crest of the weir. The effluent drain discharged into a small brook in which a dam was constructed about 200 feet from the weir. This improvised reservoir gave a storage period of from three to four hours, depending on the rate of flow from the filters. The quantity of copper sulphate applied was based on the sewage flow of 150,000 gallons. The rate of flow of the copper solution was practically constant at 75 gallons a minute. The daily application of copper sulphate to the Lancaster sand filter effluent, with its flow of 160,000 gallons a day, would require 17.3 lb. of copper sulphate, and the cost of this chemical would be about $1.04 (4*s.* 2*d.*) a day. The cost of constructing the Lancaster plant used in these experiments, and capable of treating the whole daily flow of 160,000 gallons, was $29 (5*l.* 16*s.*). An estimate is given of the cost of a plant under practical conditions for continuous treatment of this flow as $92 (18*l.* 8*s.*). The maintenance cost per annum would be $379.5 (75*l.* 18*s.*) for copper sulphate at 6 cents (3*d.*) a pound, labour (365 days) at $2 (8*s.*) a day, equals $730 (146*l.*), total $1,109.5 (221*l.* 9*s.*); capitalised at 5 per cent. this would represent an investment of $22,000 (4,400*l.*).

The sewage disposal plant at Marion, Ohio, is a combination of septic tanks, contact filters and sand filters, dealing with about 600,000 gallons of sewage daily. To provide a storage reservoir for the copper sulphate treated sewage a dam was built in the effluent sewer, about 900 feet west of the disposal plant, and a coffer dam, composed of 6-inch sheathing, was constructed at the outlet of the effluent sewer in the creek into which it discharges. The exposed height of the sheathing was such that in all but extreme flood stages the effluent would discharge into the creek in a clear stream. The object of protecting the outlet of the effluent sewer was to prevent the sterilised sewage from becoming contaminated by the water in the creek, which, as it probably contained considerable quantities of domestic sewage, would have spoilt the tests. The storage or contact period of sewage effluent and copper sulphate was about one hour. The copper sulphate solution prepared in a solution tank of about 1,780 gallons capacity was discharged at the rate of two gallons a minute. The application of copper sulphate to the Marion sand filter effluent with a daily flow of 600,000 gallons, on a basis of applying 20 parts of copper sulphate to each 1,000,000 gallons of the effluent, would cost $6 (1*l.* 4*s.*) a day for chemicals, and the cost of constructing a plant for applying the copper sulphate would be about $151 (30*l.* 4*s.*). The cost of treatment annually, using copper sulphate, would be about $2,920 (584*l.*); of this labour would be $730 (146*l.*), and chemicals $2,190 (438*l.*). Capitalised at 5 per cent. this would represent an investment of $58,000 (11,600*l.*).

(To be concluded.)

THE Electrical Company, Ltd., London, are negotiating with the West Cumberland Distribution Power Company, with the object of acquiring all the rights of the latter and erecting large electrical works on the site of the old North-Western works on the north side of Workington.

AT the Westminster coroner's court an inquest was held on the body of a carpenter, aged fifty-one, who was fatally injured while working at Somerset House. A witness said deceased was on a scaffold about 11 feet high, working under the arches beneath the Waterloo Bridge approach. While assisting in the removal of a door, he fell to the ground, and witness noticed that the scaffold planks were not nailed on as they ought to have been. The deceased was standing on two boards, each nine inches wide. The jury returned a verdict of "Accidental death," and added a rider stating that they considered the accident was due to the insecure nature of the scaffold, which was not sufficiently wide for the work to be carried out in safety.

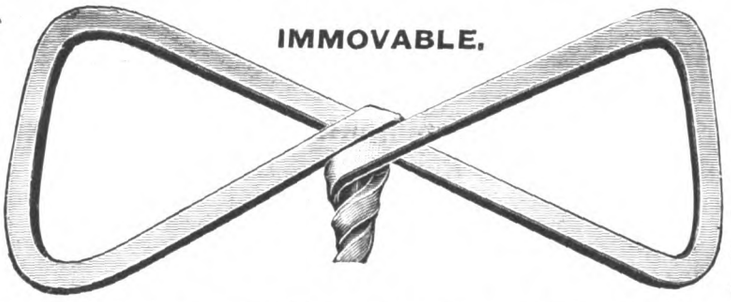
MACFARLANE'S CASTINGS

FROM SARACEN FOUNDRY. GLASGOW.

PATENT WALL TIES.

Used by H.M. Government.

All TIES Made from MILD FLAT STEEL.



Galvanised or Coated with Special Protective against Oxidation.

OVER 10,000,000 TIES HAVE ALREADY BEEN USED.

ADVANTAGES OF CAVITY TIE.

Perfect Bond with Brickwork.

The greatest possible strength with the least possible material.
Cheapness. Its construction shows that no cheaper Bond can be made.
Forms no obstruction in the cavity for mortar and other matters to lodge upon.
Cannot hold or convey damp or moisture.
Obviates the necessity of through Headers in Faced Walling.

ADVANTAGES OF SOLID TIE.

Perfect Bond with Brickwork.

Greater Economy and stability in Faced Walling.
Two straight and plumb faces to brick lengthwork.
In 12's wire for stock or other fine jointed facing.
In 10's wire for common work and outside Walling.

MADE in any LENGTH & STRENGTH for CAVITY or SOLID WORK.

Specified by the Leading Architects, and used by the Principal Builders throughout the Country.

120

Or about 2′ 9″ to 2′ 10″ Centres.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

Printed by SPOTTISWOODE & CO. LTD., at No. 5 New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, Ludgate Circus, London, E.C.—Friday, Sept. 3, 1909.

FIBRO-CEMENT *COCK BRAND* SHEETS
AND SLATES

Registered under No. 260,349, January 20, 1904.

PANELLING OF A DINING-ROOM.

The ceiling and panelling of this room, as well as the door casing, mouldings and door panels, are done with Fibrocement.

A panelling of this kind costs less with Fibrocement than if done with wood, as all glueing and assembling is replaced by a simple nailing and the superposition of sheets of various thicknesses.

Compared with wood panels, ours have the great advantage of never "playing" and never giving occasion to numerous joints of paint inevitable with wood panels. Fibrocement never rots. Once fixed to the wall, it in no way loses its shape.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

TRADE NOTES.

A LARGE clock has been erected in the parish church, Blackwell, near Alfreton, which chimes the quarters, strikes the hours, and shows time on three large dials. The work has been carried out by John Smith & Sons, Midland Clock Works, Derby.

MESSRS. OETZMANN & Co., LTD., Hampstead Road, W., supplied the furniture for the new play "Madame X," which was produced for the first time last week at the Globe Theatre, Shaftesbury Avenue. The scenes, which include a room in an hotel, a court of assize, and two different studies, are all in France, and offer scope for varied treatment.

THE Carron Company have just executed an important order for fire-grates for the Ameer of Afghanistan's new palace in course of erection at Cabul. These firegrates—twenty-two in number—are fitted with dogs to harmonise, together with heavy canopies of various designs, the whole being of a very high-class character. The designs, which have been approved by the Ameer, are essentially Oriental in style, presenting a very striking and handsome appearance, while on the brass work, of which the firegrates are almost wholly composed, much hand labour has been involved. A special feature of these fire-grates is the unusually large fire, on the assumption that wood will be burned as fuel. The grates are chaste in design, and are elaborate and beautiful examples of the ironfounder's art.

THIS week a demonstration was given by Messrs. Spagnoletti, Ltd., of Goldhawk Road, W., of their new electric water-heater "Therol." The apparatus may be described as a block of iron (continuously heated from within by electricity) cast about a coil of pipe through which water is passed when desired. It is encased in a thick coat of insulating material, which is in turn surrounded by the circular water tank, likewise well lagged. The main principle is that continuous electricity is thus accumulated and stored until required for heating the water. The initial cost of a No. 1 Therol electric heater (sufficient for the needs of a small household), having an average consumption of 200 watts and heating about 30 gallons a day, is fifteen guineas. The electricity used to raise the temperature of 25 gallons of water up to 110° F.—*i.e.* the temperature of a very hot bath—or to produce 9 gallons of boiling water, is estimated to cost about 1*l.* 2*s.* 6*d.* per quarter at .61*d.* per unit. This figure of .61*d.* per unit is that resulting from the ½*d.* per unit, plus 1*l.* per kilowatt per quarter, quoted by a number of stations when the power is taken continuously throughout the day and night—that is to say, for consumers with a 100 per cent. load factor. The manufacturers make out a strong case as to the wisdom of the electric supply authorities making an arrangement with purchasers of the "Therol" water-heater for the supply of current at the above rate. On their agreement the success of the invention seems to depend. The apparatus is self-contained and involves small alteration to existing pipes. It occupies little space, obviates the risk of fire, does not contaminate the air, and requires no attention whatever. The hot water is always available the instant the tap is turned, and may be drawn off at any desired temperature from quite cold to boiling.

BUILDING AND BUILDERS.

THE Bury Town Council are about to apply to the Local Government for permission to borrow 11,000*l.* for its housing scheme.

THE congregation of Dumfries Free Church, N.B., have decided to erect a church in George Street, at a cost of 1,100*l.* The congregation have 1,000*l.* in hand.

THE Scarborough Corporation have approved in committee a plan for the construction of a shelter, at a cost of 650*l.*, on the Marine Drive, and the construction of a terrace, adjoining the shelter, at a cost of 258*l.*

THE India Rubber, Gutta Percha and Telegraph Works Company, Ltd., Silvertown Works, West Ham, are contemplating the erection of an additional factory in the country. A site may be selected in the Midlands.

THE Johannesburg Town Council have decided to build a town hall at a cost of 125,000*l.* The building is to include galleries, and seating accommodation for 2,000 persons, organ loft, Council chamber, &c.

THE Alexandra Park Property Company, 65 Bath Street, Glasgow, have been authorised by the Dean of Guild Court to erect five tenements of dwelling houses in Aberfeldy and Walter Streets, and a new street off Cumbernauld Road, Glasgow.

AT a meeting of the Falkirk Dean of Guild Court, Jack W. Morris, The Tower, Portobello, was granted warrant to make alterations on the premises at Springfield, formerly occupied by the Diamond Foundry Company, and to form them into a roller skating rink, with platform, cloak-rooms, and other conveniences.

NEW sewage-disposal works are to be constructed at Oswestry immediately, at a cost of 6,000*l.* A committee of the Town Council has also been appointed to take steps to convert Caeglas, recently acquired at the cost of 6,000*l.*, into a public park.

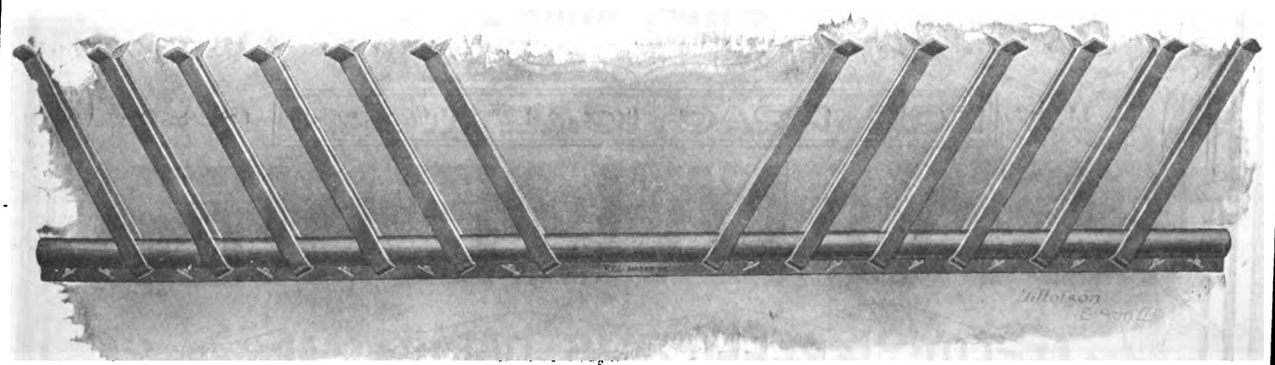
THE following plans were last week approved by the Spennymoor Council:—Two shops and parish hall in High Street, for trustees of National Schools; four houses and shop in High Grange Road, for Mr. W. S. Gill; extension to mineral water factory in Armoury Street, for Mr. J. Pickering.

MESSRS. EASTON GIBB & SON have decided to erect a private central power station for the distribution of electric light and power throughout the entire works at Rosyth naval base. The National Gas Engine Company, Ltd., Ashton-under-Lyne, have received the order for the installation of four gas engines and suction gas plants.

NEW offices are to be erected for the health and cleansing departments of Blackpool Corporation. At the last meeting of the general purposes committee plans were submitted estimated to cost 3,500*l.* These were referred back for the purpose of the borough surveyor preparing a more ornate design at an additional cost of 1,000*l.*

THE County Council of Durham give notice of their intention to erect elementary schools at Easington Colliery (1,700 scholars), Seaham Harbour (480 children), New Seaham (450 children), Close House, Coundon Grange (500 children), and at Shiney Row, Penshaw (800 children). It is proposed to enlarge the Council school at Newbottle by providing additional accommodation for about 300 children.

THE new sewage disposal works which were opened at Burslem in September last, and in which an outlay of about 40,000*l.* was involved, have not proved the anticipated success owing to the failure of the septic tanks. The manager asked for 11,936*l.* to carry out the necessary alterations. Last week, after a long discussion the Town Council agreed to expend 6,500*l.* on the work.



THE War Office have placed with the Cleveland Bridge and Engineering Company, Ltd., of Darlington, a contract for the construction of a large building of all-steel construction for housing dirigible balloons at Cove Common, South Farnborough. Designs were invited from four leading British structural engineering firms. The building will be at the disposal of the military authorities twenty weeks from date.

THE general purposes committee of the Garden Cities and Town-Planning Association, after considering the amendments made in committee to the Housing and Town-Planning Bill, express the hope that differences of opinion as to Clause 30 will not be allowed to stand in the way of a smooth passage for the Bill through both Houses of Parliament. The committee hope that the principle of town planning will

Avoid uncertainty and worry by insisting on your Concrete being reinforced with

The PERFECTOR TRUSSED BAR

the only Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.

The only system which is proof against the carelessness of workmen.

The Perfector Bar Reinforced Concrete Co.,

Telegrams: "REINFORCED, LEEDS." STANDARD BUILDINGS, LEEDS.

be incorporated into law at the earliest moment, and they deprecate any action which would jeopardise it.

THE building trade in Northampton is reported as being satisfactorily busy and of having prospects of becoming still more so. Among the public works in progress are:—Free library, extensions to the county hall, a county sanatorium at Creaton (Mr. Fred Dorman, architect), a school in Billing Road (Mr. Herbert Norman, architect), renovations at Kingsthorpe and St. Sepulchre's churches, golf club pavilion at Harlestone (Mr. Herbert Norman, architect), in addition to new houses, factory extensions and other works.

AT New Southgate last week an inquest was held on a carpenter who fell from a scaffold at East Finchley, and was almost instantaneously killed. The evidence showed that the scaffold was 16 feet from the ground, and the plank upon which the deceased stood 18 inches wide, and there was no guard round the scaffold. The jury returned a verdict of "Accidental death," and added a rider to the effect that all scaffolding, in their opinion, above the height of 12 feet should have a guard around it. This rider was ordered to be sent to the Home Office.

PLANS and sections of proposed new buildings, &c., in Dundee, have been lodged at the office of the city engineer, as follows:—Balgay Road, dwelling house for Marshall Meek; Clepington Road, stable for Robert Taylor & Sons, Ltd.; East Dock Street, roller skating rink for W. S. Cruickshank & Co.; Exchange Street, office and wash-house for David P. Whitton & Sons; Hawkhill, patching house and store for Thos. Bell & Sons; Jedburgh Road, dwelling house for David Grant; Murraygate and Cowgate, shops, offices and dwelling houses for Jas. Sibbald; Seagate, dwelling-house, office, and shed for Dundee Motor Carriage Company.

AT a recent meeting of the streets and buildings committee of the York Corporation, the following plans were approved:—British Petroleum Company, spirit store, Foss Islands Road; F. Clark, new stables and additions to house, 14 Vine Street; W. E. Jackson, alterations and additions to warehouse, Hallfield Road; G. H. & H. Douglas, two houses, Siward Street; W. West, four houses, Knavesmire Crescent; W. Walls, eight houses, Westwood Street; E. Relton, six houses, Lower Sutherland Street; A. D. Stuart, alterations, Crown Cottage, Heworth Green; J. J. Hunt, Ltd., roof covering, Queen Victoria Street; W. H. Waudby, new shop, Fossgate; Mrs. Forth, re-drainage, 32 and 34 New York Terrace; Barclay & Co., reconversion of shop into dwelling-house and shop, 36 Parliament Street.

DURING the month the following plans have been approved in Bolton:—Colonel R. H. Ainsworth, for addition to Moss Lea, Sharples; Mr. J. Haslam, for dairy at Edditch Fold Farm; Mr. James Taylor, for two houses off Entwistle Street; Mr. G. A. Hirst, for seven houses in Tonge Moor Road, Tonge; Mr. James Hoyle, for wash-house at 578 Bury Road, Breightmet; Mr. F. H. Cartwright, for twenty-one houses in Longfield Road, Halton; Mr. Oliver H. Haslam, for house in Victoria Road, Heaton; Mr. John Ives, four houses in Waddington Road; Messrs. Leigh Bros., for five houses at Halliwell Hall; and Mr. J. R. Ormrod, for two semi-detached villas in Newhall Lane, Smithills; T. E. Smith & Son, for addition to St. Thomas's School, Eskrick Street; Bolton education committee, for manual instruction school in Folds Road; Messrs. Crosses & Winkworth, Ltd., for new engine-house at No. 1 mill in Lever Street; Messrs. Cannons, Ltd., for extension to mill in Jackson Street; and Messrs. J. W. & J. P. Pilling, for eight houses off Bennett's Lane.

THE building plans committee of the Blackpool Corporation at their monthly meeting approved of twenty-two of the forty-five plans submitted. The plans sanctioned were as follows:—Detached dwelling house, greenhouse and buildings, Peddar's Lane, South Shore, J. W. Cardwell; three houses, Marlborough Road, John Whiteside; two houses, Westfield Road, John Porter; two houses, Whitegate Drive, A. J. Haworth; one house, Moon Street, Wm. Bamber; two houses, off Holmfield Road and Warbrick Hill Road, Jas. Leach; ten cottages, Onslow Road, G. F. Clarke; house and shop, corner of St. Walburga's Road and Onslow Road, Joseph Wignall; house, Park Road, Misses H. C., E. and M. J. Gourlay; eleven houses, Oxford Avenue, John Gregson; two houses, Palatine Road, Wm. Bailey; four houses, St. Alban's Road, Frank Lumb; elementary school, Queen Victoria Street, Blackpool education committee; elementary

VARIETIES.

THE Blackpool Town Council has confirmed a resolution appointing a sub-committee to consider a proposed extension of the promenade at South Shore to the borough boundary.

THE Wigton Board of Guardians on Tuesday decided to have the whole of the drainage system of the workhouse remodelled, thus doing away with the old system of cesspools.

EXCAVATIONS have been commenced preparatory to the erection of Messrs. Parkinson & Tomlinson's new mill adjoining the present premises in Chapel Street, Poulton. The new building will be four storeys high, and 74 feet long by 34 feet wide.

MAJOR J. STEWART, R.E., the inspector of the Local Government Board, will hold an inquiry on September 17 into the application of the Sheffield City Council for sanction to borrow 30,361*l.* for the purchase of land at Blackburn Meadows, Rotherham, for purposes of sewage disposal.

PLANS have been deposited at the borough surveyor's office, Derby, for a hippodrome and music-hall to accommodate 2,000 people, which the North-Midland Theatres Syndicate, Ltd., contemplate erecting at the corner of Macklin Street and Green Lane.

MESSRS. SPRAKES & SON, of Doncaster, have secured the contract for the erection of three lock-up shops and organ factory, at the Factory Lane end of Trafford Street, Doncaster, the amount being 3,000*l.* Messrs. Rudolf Wolff & Sons' works from Bradford and Nether Hall Road, Doncaster, are to be removed to these new premises.

A SCHEME of main sewerage and sewage disposal for Norham has been submitted to the Norham and Islandshires Rural District Council by Messrs. D. Balfour & Son, of Newcastle-on-Tyne and London. The works consist in the providing of main sewers for the drainage of the town and the disposal of the sewage by liquefying tanks and continuous filters, the effluent from which will be discharged into the river Tweed. The storm water will be dealt with in storm-water tanks without further treatment.

THE Warrington Town Council on Tuesday considered a recommendation that the borough surveyor should prepare a statement and description of a new bridge across the Mersey, and that specifications, designs, and tenders should be obtained from firms experienced in ferro-concrete work. It was ultimately agreed that the recommendation should be referred back, with a view to the appointment of a special engineer.

CHATSWORTH HOUSE, which has been closed to tourists during the past year owing to extensive alterations being carried out, is to be reopened. The Duke of Devonshire proposes to open the house from the first Tuesday in May till the first Friday in August, on Tuesdays, Wednesdays and Thursdays. A charge of one shilling will be made for each person. A short guide-book and competent guides will be provided free of charge. The average number of tourists is about 80,000 a year.

THE manner in which the enterprising engineer can study economy is provided by an instance at the Cane Hill asylum of the London County Council. A system of centralisation of the hot water arrangements is being introduced to replace the old-fashioned system under which the hot water was kept in as many as thirty-six separate storage tanks located in the roof spaces of the various wards. By introducing the system of one huge tank in a tower and pumping the water

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

Digitized by Google

to the wards, a saving of hundreds of pounds will be effected. Under the old system the quantity of steam coal used was about 3,500 tons a year, costing about 4,200*l*. By the new system a reduction in the coal bill of 520 tons a year is anticipated. The new system has already been introduced at some of the big asylums and the saving effected has proved to be even greater than the estimated saving at Cane Hill.

SANITARY CERTIFICATION OF DWELLINGS.

THE annual congress of the Incorporated Sanitary Association of Scotland was held in Ayr last week. Amongst the numerous papers read was one by Mr. Robert Adam, sanitary inspector, Ayr, on "The Sanitary Certification of Dwelling-houses." The following report appears in the *Ayr Obeserver*:—He said that in view of the provisions of Clauses 14 and 30 of the Housing and Town-Planning Bill the question appeared to be worthy of discussion. The increased knowledge of hygiene that now obtained among the people had caused a more intelligent interest to be taken in the sanitary condition of houses, and more particularly those intended to be occupied by new tenants. This was reflected by the increasing number of inquiries by intending occupiers and summer visitors as to whether such and such a house was "sanitary" and "the drains all right." "No man should, and no prudent man will become the tenant of a house without first having the drains and sanitary arrangements examined, and, if a tenant enters into possession without having done so, he may, in my opinion, fairly enough be assumed to be satisfied that they are in order, and to have taken the risk of any latent defect." So said an eminent judge in giving judgment in an action for damages arising from bad drainage. Experience showed that a very large proportion of the people were ignorant in matters of house construction and sanitary fitments, and, unless where there were defects on the surface visible to the eye, they were unable to judge for themselves as to whether a house was reasonably fit for habitation. Surface defects might be readily noticed by the tyro, but surface defects did not constitute all the danger. It was those under cover and hidden from view that the greatest danger came from. This led him to the principle that he contended for in the paper—that every new or intending tenant of a house, no matter the amount of rent to be paid, should be entitled, on application to the sanitary authority, to receive a certificate that such house had been surveyed, and was or was not reasonably fit for human habitation at the time of entry. Of course, there were cases where a tenant, in removing from one house to another, had to submit to a good deal of discomfort and inconvenience. He must often take possession, for instance, before the necessary re-papering and painting of the house was completed, or minor repairs made on the plaster and woodwork, but these, though disagreeable, were nothing more. It would be unreasonable to say that repairs like these rendered the house untenable at the time of entry. It was a very different thing when the house was insanitary through defects of structure, defects of ventilation, and other similar defects that went to make a house uncomfortable and dangerous to the inmates. Having described the system of sanitary certification practised in Ayr, Mr. Adam went on to say that if the principle of certification was right in regard to new buildings, it seemed to be all the more needed at existing buildings, because new houses might soon become insanitary through the breakages caused by the settlement of the ground and walls of the building, and existing houses through wear and tear of the structure, misuse of the sanitary appliances, and the absence of skilled supervision of repairs made on the drainage system. This latter was, in his experience, the most prolific cause of defects, and has spoiled and made dangerous many of what were otherwise good and efficient systems of drainage. To protect himself and family the prudent tenant has recourse to one or other of the private expert agencies for guidance and help. He did not object to appeals to such agencies, but the cost of employing these agencies was beyond the reach of most people, and was confined to the comparatively rich, and he contended that intending tenants of existing houses were entitled to look to the sanitary authority, as guardians of the public health, for guidance and advice on a matter that concerned so very much the health of their household. This appeared to be the view adopted in the 30th Clause of the Housing and Town-Planning Bill. In that clause every local authority was required to cause to be made in every

parish or district an inspection and survey of every dwelling-house. The local authority was also required to keep a register, and to register particulars concerning every dwelling-house within their district. The particulars were to include, amongst other matters, the number and description of rooms and offices in each house, the state of repair of the dwelling, and its sanitary condition and water supply. The register was to be open for inspection by any ratepayer within the county or district. The first survey and register was to be commenced within twelve months and completed within five years after the passing of the Bill, and a new survey was to be made and the register revised every five years thereafter. A clause such as that must have a far-reaching effect for improvement in house sanitation, and the advantages to be gained from registration and periodical inspection of dwellings could not be over-estimated. The clause, however, had several defects. Like Clause 14, its operations were limited in Scotland to houses rented at 16*l.* and under. Why that should be so was difficult to understand. It could not be said that all houses rented at over 16*l.* were not in as much need of registration and periodical inspection as those to which the clause was confined. In practice it was found that the better the class of house the greater the possibility of sanitary defect, because the number and variety of conveniences provided were greater than in cottages and tenement houses. Another defect was that ratepayers only had the right to inspect the register. That was hard on a person who purposed taking a house in another town, or the townsman taking up house who had not yet qualified as a ratepayer. He was to be debarred from getting information from an accredited authority as to the sanitary condition of the house for which he was negotiating. The same with the visitor who purposed taking up quarters for a time at any of our coast towns or health resorts. Of course, there might be objections to allowing all persons getting access to the register, but surely *bonâ-fide* applicants such as these were entitled to the same privilege as accorded in the Bill to ratepayers. It might be said that the surveying and sanitary certification of dwellings were outside the province of a local authority, that they would interfere with private enterprise, and that officials could not afford the time for the work. He did not agree with this view. On the contrary, he thought that, as guardians of the public health, it was the duty of the local authority to encourage and help persons seeking advice and assistance in matters affecting the health of their household. Certification would necessitate the thorough inspection, and therefore the detection, of any insanitary conditions, and it was surely better for a local authority to prevent the danger from these conditions than to attempt to right it afterwards. It was not proposed to act in competition with private agencies. Persons preferring private agencies, and able and willing to pay for the same, were not precluded from doing so. Apart from that, it was a well-established principle that private interests in matters affecting the public health must give way to the public interests. With regard to the extra demands likely to be made on the time of sanitary officials, he thought that would prove more imaginary than real. No matter how some might deplore the fact, it had also to be pointed out that the careless and indifferent tenant was not likely to give trouble in this respect. This class formed a fairly large proportion of the yearly removals, and they were usually satisfied to find the papering and painting work to their taste, and the house generally not likely to give trouble in the way of cleaning. It was from the prudent and right-thinking persons that most of the applications for certificates would come, and he submitted that this was a class that deserved every encouragement in this direction from local authorities, for by precept and example, and living to sanitary conditions, they helped very materially to educate the careless and indifferent to their duties and responsibilities in matters affecting the public health.

THE NAPIER BRIDGE, AT MADRAS.

CONSTRUCTION of a new bridge to replace the present old structure, known as the Napier Bridge, at Madras, has at last been sanctioned by the Indian Government, at an estimated cost of 3 lakhs of rupees. The original proposal was, says *Indian Engineering*, to construct a bridge which might eventually be used as a regulator in connection with a scheme for improving the Cooum River; and designs were prepared for a masonry bridge with small spans of 40 feet and with

Digitized by Google

a floor, but this involved the raising of the roadway some 8 feet above the general level of the Marina, rendering necessary the construction of long ramps, which would not only be expensive, but also objectionable from the point of view of traffic. It was also found that the provision of gates could only be of service either in connection with a canal harbour scheme under which the Cooum would be filled by the incoming tide through the canal and emptied on the ebb through the gates, or in connection with a pumping scheme to raise the level of the water in the Cooum above sea-level and to give it periodical flushings by means of the gates. There is, however, no probability at present of a canal harbour scheme being undertaken, and a grave objection to the pumping scheme is the fact that owing to the low level of the area in the city of Madras known as the "Island" and of other areas in the vicinity, it would be impracticable to raise the water level of the river to any appreciable extent above sea-level without flooding these areas. The original proposal has accordingly been abandoned, and the present scheme provides for an ordinary bridge for traffic purposes only. The design is for a bridge of six spans of 75 feet each; including the space occupied by the piers the length between abutments will be 480 feet. Provision is made for a 27-foot roadway and a pathway 9 feet wide, the total clear width between girders being 36 feet. The loads allowed will admit of a 15-ton road-roller being used on the bridge, and a crowd load of 100 lb. per square foot; this provision seems suitable for all contingencies. The steelwork will consist of twelve main girders for the six spans, and sixty-six cross girders (eleven to each span). The flooring will consist of concrete arching reinforced on the soffit with expanded metal. This form of roadway has been especially adopted in order to cover the steelwork of the cross girders and to have no steelwork exposed to the air in those parts of the bridge which cannot be easily inspected, the bridge being near the sea. Altogether the new bridge will be a substantial structure for up-to-date loads, and the only exposed steelwork will be in the main girders, which can be easily got at and which will be efficiently painted at regular intervals. The new bridge should therefore last a considerable time. Half the estimated cost of the work will be borne by the Corporation of Madras.

GERMAN CEMENT PRODUCTION.

ACCORDING to the British Consul at Hamburg the expectations of the German cement industry at the commencement of 1908 were not fully realised. In consequence of the financial crisis there was a falling-off in the building trade, and particularly in the building of cheap houses, and the owners of factories which were not fully occupied showed little inclination to embark on alterations or extensions, and therefore large stocks of cement accumulated during the summer at the cement factories. The latter sought relief in the export market, with the result that the export prices experienced a rapid fall of nearly 25 per cent. Owing to the demand brought about by these low prices several of the syndicates disposed of a considerable portion of their stocks. The financial results realised during the year by the German cement works were nevertheless regarded upon the whole as good, in spite of the unfavourable state of trade, because the prices, regulated in the interior of Germany by means of agreements between the syndicates, ensured a good profit. These agreements have been renewed for 1909, and among the German cement works there has for several months past been an effort to raise the export prices, which had sunk far below the normal. Steps have, moreover, been already taken in this direction, and a minimum price has been fixed. It is said also that efforts have been made with some success to secure the adhesion of the British and Belgian cement industries, and it is anticipated that it will be possible to form international agreements for the regulation of export prices. The total output of cement in Germany in 1908 is estimated to have been as follows, in casks of 180 kilos.:—

Portland cement	23,000,000
"Iron" Portland and Schlodron .	2,250,000
Roman	650,000
Total	25,900,000

The factories are, however, said to be capable of turning out nearly double this quantity. Of the total number of cement factories in Germany—viz. 142—ninety-seven manufacture only Portland.

WATER-POWER IN CANADA.

THE address of Sir W. H. White, K.C.B., as President of the Engineering Section of the British Association, was mainly devoted to an illustration of the close connection which exists between the work of civil engineers and the foundation as well as the development of British Colonies and Dominions beyond the seas. One of the chief fields of engineering operations at the present time is, he said, to be found in the Dominion of Canada, whose governing authorities have appreciated the fact that bold enterprise and generous financial provision for the execution of great engineering works are essential to the progress and prosperity of the country. Its vast extent, its magnificent lakes and rivers, its agricultural and mineral riches, its forests, its unrivalled water-power and many other potential sources of future wealth and progress, furnish exceptional incentives and opportunities to the engineer. From an early period in the history of Canada this fact has been realised, and attempts have been made to utilise natural advantages; while the same policy has been energetically adopted since the Dominion was established forty-two years ago. After dealing with railways, inland navigation and shipping, Sir William went on to speak of water-power as follows:—

Canada has unrivalled resources in water-power, and its extent and possible utilisation have been made the subject of investigation by engineers for many years past. One of the most important memoirs on the subject was presented to the Royal Society of Canada in his presidential address of 1899 by Mr. Keefer, C.M.G. In recent times many other engineers have studied the subject and carried out important works. Exact knowledge of the total power represented by the waterfalls and rapids of the Dominion is not available, nor can any close estimate be made of the power which may be employed hereafter in factories, mills, or industrial processes, because profitable employment obviously depends upon commercial considerations, which must be governed largely by the localities in which water-power may be found, and the cost of works and of transmission of energy to places where it can be utilised. It has been estimated that on the line from Lake Superior through the chain of lakes and rivers leading to Niagara and thence through the St. Lawrence to the sea 11,000,000 horse-power may be developed. Mr. Langelier has estimated that in the Province of Quebec the water-power aggregates more than 18,000,000 horse-power; other provinces all possess large resources of the same kind as yet untouched. The most striking example of the utilisation of water-power is that on the Niagara River, which the writer had the good fortune to visit in 1904, during his presidency of the Institution of Civil Engineers; the works on the Canadian side were then in full progress, and at a stage which enabled one to realise completely their great difficulty and immense scale. The three companies whose works are near the Falls on the Canadian side have provided for a total ultimate development of over 400,000 horse-power, and a fourth establishment lower down the river, intended chiefly for the use of Hamilton, is to develop 40,000 horse-power. In the construction of the works, in the electric generating plant, the arrangements for transmitting power over long distances, and other features of importance remarkable engineering skill and daring have been displayed. American capital and enterprise have had much to do with these undertakings, as they have with many other important Canadian enterprises; but it may be hoped that British capital will keep its lead and be freely employed in the development and utilisation of all the resources of the Dominion, including that magnificent asset its water-power. The applications of water-power are already very numerous, including not merely the creation of electrical energy and its use for lighting and power in towns and factories situated at considerable distances from the Falls, but for manufactures and industrial processes carried on near the Falls. Amongst these manufactures that of aluminium and carbide of calcium may be mentioned, while paper and pulp mills and sawmills constitute important industries. Great advances have been made in the transmission of electrical power over long distances, and very high pressures are being used. Electric traction on railways and tramways also derives its power from the same sources, and is being rapidly developed. In 1901 there were 553 miles of electric railways, and in 1907 815 miles.

THE Girvan School Board, N.B., have agreed to the erection of a higher-grade school at a probable cost of 7,000*l*. A site has not yet been purchased.

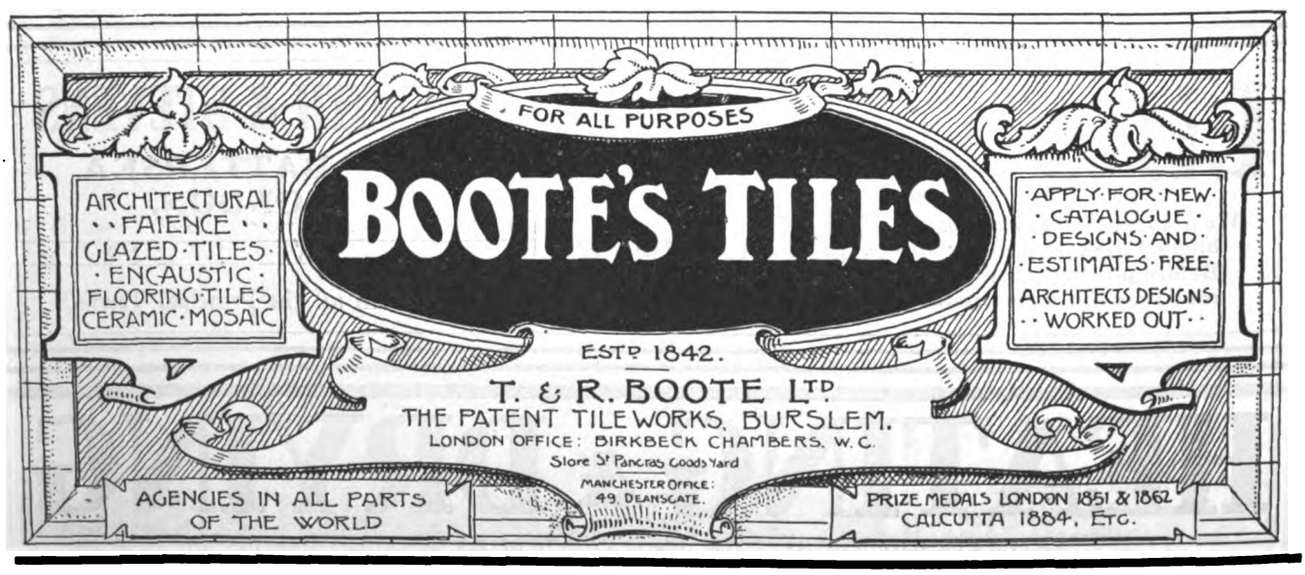
THE PRACTICAL STERILISATION OF WATER AND OF SEWAGE EFFLUENTS.*

(Concluded from last week.)

Chlorine Experiments.



FOR the chlorine experiments, calcium hypochlorite or bleaching powder was selected, costing 4 cents. (2*d.*) per pound, and showing on analysis 34 per cent. of available chlorine. It was found that unless special precautions were taken in dissolving the chloride of lime, many large lumps which enclose chlorine remained, and materially reduced the efficiency of a given weight of the chemical. A weighed quantity of chloride of lime was placed in a shallow box and covered with sufficient water to form a smooth paste. Warm water was then added until the heavier particles settled, thus allowing the soluble and finely divided chloride of lime to be decanted. After decantation more water was added, the coarse lumps were broken up, and the process repeated until as much as possible had gone into the solution.

Experiments were carried out at the Boys' Industrial School, Lancaster, Ohio. The sand filter effluent was treated with available chlorine varying from 3.6 to 4 parts per 1,000,000, taking the daily average. Coli organisms were completely removed, and the removal of the total number of organisms was from 99.8 to 99.9 per cent. The solution was discharged into the sewage at the rate of .75 gallons a minute, and variations in the quantity of chlorine applied were made by changing the strength of the hypochlorite solution. The cost of constructing the plant for treating sand filter effluent in this manner may be taken at $92 (18*l.* 8*s.*), and it is estimated that the annual cost of applying 4 parts to the 1,000,000 of available chlorine to a sand filter effluent flow of 160,000 gallons per diem would be about $924 (184*l.* 16*s.*), including labour, proportioned as follows:—7,770 lb. of chloride of lime at 2½ cents per pound, $194.25 (38*l.* 17*s.*); labour, one man 365 days at $2 a day, $730 (146*l.*). Capitalised at 5 per cent., this would represent an investment of $18,500 (3,700*l.*).

At Marion the rate of application of the chloride of lime was three gallons a minute. Experiments were carried out with the effluents from sand filters, from contact beds, and from septic tanks. The effluents from the sand filters were treated with a quantity of chlorine equal to 3.8, 3.0, and 1.5 parts to 1,000,000, which removed 99.8, 99.7, and 94.3 per cent. of the total number of organisms respectively. The coli appear to have been entirely removed, excepting in the case of effluent treated with 1.5 parts to the 1,000,000. The effluent from the contact beds (which, by the way, do not appear to have been properly used, seeing that they were at times acting as streaming filters), contained organic matter of a more putrescent character than did the sand effluent, and at the end of the discharge the strength of the chlorine applied had to be greatly increased, the quantity ranging from a minimum of 1.7 to a maximum of 31.8 parts per 1,000,000. It appears, therefore, that the results are not of much value as a basis for contact beds in proper condition and properly worked, for it is obvious that when a contact bed is at times used as a streaming filter, it is likely to become foul, and that the experiments must have been conducted with a liquid of very poor quality, not comparable with a good contact bed effluent. An average quantity of chlorine of 2.9 parts to 1,000,000, however, sufficed to remove 97.8 per cent. of the total organisms, and bacillus coli could not be detected in .5 cubic centimetre of the effluent after treatment. With an average of 5 parts to the 1,000,000, the reduction of the total organisms was 99.5 per cent., bacillus coli being usually absent in .5 cubic centimetre. With an average of 4.4 parts to the 1,000,000, the total removal of bacteria was 99.8 per cent., and bacillus coli was usually absent in 1 cubic centimetre. It should be observed that in these tests, both in the case of the sand filter and of the contact bed effluents, the tests for residual chlorine in the treated effluent were always negative at the end of the tank. The addition of 5 parts of chlorine to the 1,000,000 in the case of septic tank effluent did not suffice to effect very material removal of either total bacteria or fermenting organisms. The 25 parts to the 1,000,000 of applied available chlorine were sufficient to remove a substantial

Digitized by Google

proportion of coli-like organisms, although a complete removal of bacillus coli was not accomplished. An addition of 48.5 parts to the 1,000,000 was found to give results only slightly better than in the case of the application of 25 parts to the 1,000,000. But it is noted that the amount of suspended matter in the septic tank effluent had increased considerably, and this probably in large part explains the low removals obtained by that increased quantity of applied chemical. This clearly emphasises the fact that it is difficult to sterilise the effluent from an ordinary septic tank, and that some special provision must be made in such cases to avoid large masses of organic matter coming over the tank weir. The cost of constructing plant for treating the several effluents at the Marion sewage works may be taken as $151 (30*l.* 4*s.*), allowing for the continuous treatment of 600,000 gallons in twenty-four hours. The cost of applying 4 parts to the 1,000,000 of available chlorine to sand filter effluent is $730 (146*l.*) only. The total annual cost, including labour, but excluding the cost of supplying water for preparing the chlorine solution, will be about $1,620 (324*l.*); capitalised at 5 per cent. this would represent an investment of $29,000 (5,800*l.*). The cost of applying 5 parts to the 1,000,000 of available chlorine to the contact filter effluent of poor quality for reasons above stated would be about $2.5 (10*s.*) a day, requiring about 100 lb. of the chemical; the total annual cost, including labour, but excluding water supply, would be about $1,640 (328*l.*); capitalised at 5 per cent. this would represent an investment of $34,000 (6,800*l.*). Similarly, assuming 25 parts to the 1,000,000 as a fair average figure for the sterilisation of septic tank effluent, provided this effluent is at all times free from abnormal amounts of suspended matters, the total annual cost, including labour, would be about $5,300 (1,060*l.*). Capitalised at 5 per cent. this would represent an investment of $106,000 (21,200*l.*). The author has attempted to give a brief review of this important American report, which should, however, be studied in its entirety.

Baltimore Sewage Sterilisation.

In the course of a discussion upon a paper read before the Boston Society of Engineers by Mr. H. W. Clarke, chemist of the Massachusetts Board of Health, Prof. Winslow stated that the problem of the removal of bacteria from effluents was not only well in hand, but it was now generally recognised that it could be accomplished sufficiently and economically by treatment with chloride of lime. Later another speaker said :—" During the past year we have, with the collaboration of Prof. Phelps, carried out in Baltimore at the Walbrook sewage testing station a series of experiments on the disinfection of sprinkling filter effluents with solutions of chlorine bleaching powder. Our results have been so extremely satisfactory that the final plants for the sewage disposal works at Baltimore will include a chlorine disinfection plant."

It is considered probable that it will be practicable to secure an effluent as well purified and as stable from a shallow bed, treated with large quantities of chlorine, as can be obtained from a deeper bed treated with small quantities of chlorine.

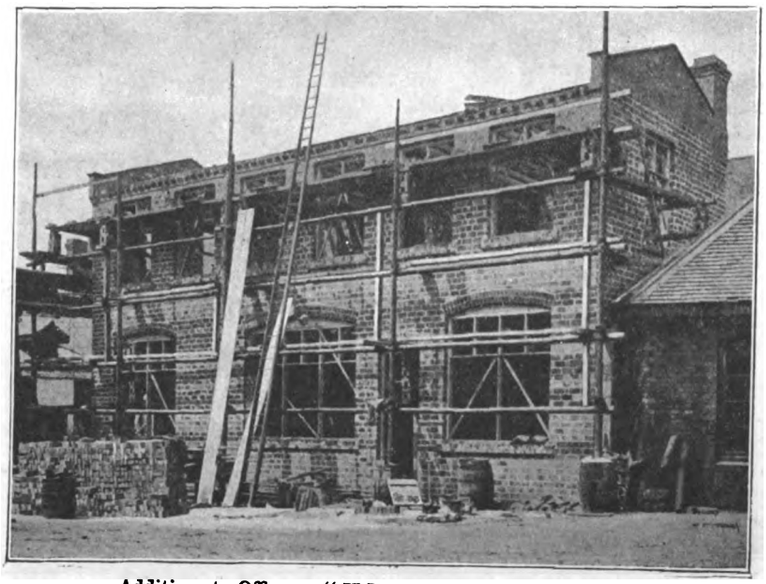
Conclusions.

It is difficult to compare prices exactly owing to the varying conditions in the cases concerning which figures are to be obtained.

The prices which are available show what at first appears to be an almost incomprehensible difference, but they are not quoted for comparison, but merely as a matter of general interest.

For instance, at Marion, Ohio, the cost of sterilisation per 1,000,000 gallons with chloride of lime appears to be about 27*s.* 8½*d.* (4 parts of available chlorine per 1,000,000), while at Boston, with 5 parts of chlorine per million, the cost is 4*s.* 4½*d.* per 1,000,000 gallons.

We are told in a paper read before the Nova Scotia Society of Engineers that the cost of sterilising the Philadelphia water by the Vosmayer ozone process costs from 6*s.* 6*d.* to 15*s.* 2*d.* per 1,000,000 gallons. Here the water is very bad.



The figures of the Lahmeyer Company, which presumably refer to a water of average quality, give a price of from 41*s.* 8*d.* to 62*s.* 6*d.* per 1,000,000 gallons, taking the cost of the electrical power at from 1*d.* to 1½*d.* per unit and allowing for many things probably omitted in other prices.

Dr. Rideal, in his paper referred to, gave an estimate relating to Paris, where, assuming the cost of the electric

power to be .055 fr. per unit (a very low figure), the cost of ozone sterilisation would be ¼*d.* per 1,000 gallons, or 27*s.* 9*d.* per 1,000,000 gallons.

The treatment of sewage by ozone appears, from the figures given in this paper, to be about 6*l.* 11*s.* per 1,000,000 gallons.

In the Digby-Shenton paper already referred to it was demonstrated that at London prices 1 kilogramme of available chlorine in the form of hypochlorite can be produced by modern electrolysers with guaranteed output for 10*d.*, taking electrical power at 1*d.*, per unit and salt at 1*d.* for 10 lb. This price does not include labour. Working on the basis given the cost of treatment would be as follows:—

Parts per million of Chlorine.	Price per million Gallons treated.	
	s.	*d.*
1	3	9½
2	7	7
3	11	4½
4	15	2
5	19	0

It was established by Drs. Kautbach and Rideal in the Maidenhead experiments, that 1 gramme of available chlorine would sterilise 1.21 cubic metres of settling tank effluent, or 1.5 cubic metres of filter effluent. In any good modern electrolyser 1 B.T.U. will produce from 152 to 200 grammes of available chlorine. Taking the lower figure we obtain sterilisation of an unfiltered sewage effluent at a rate of 24.95 B.T.U. per 1,000.000 gallons by hypochlorite as against the rate of 133 B.T.U. per 1,000,000 gallons by the ozone process at Paris, as described by Dr. Rideal in his ozone paper, which process was dealing with water and not with sewage.

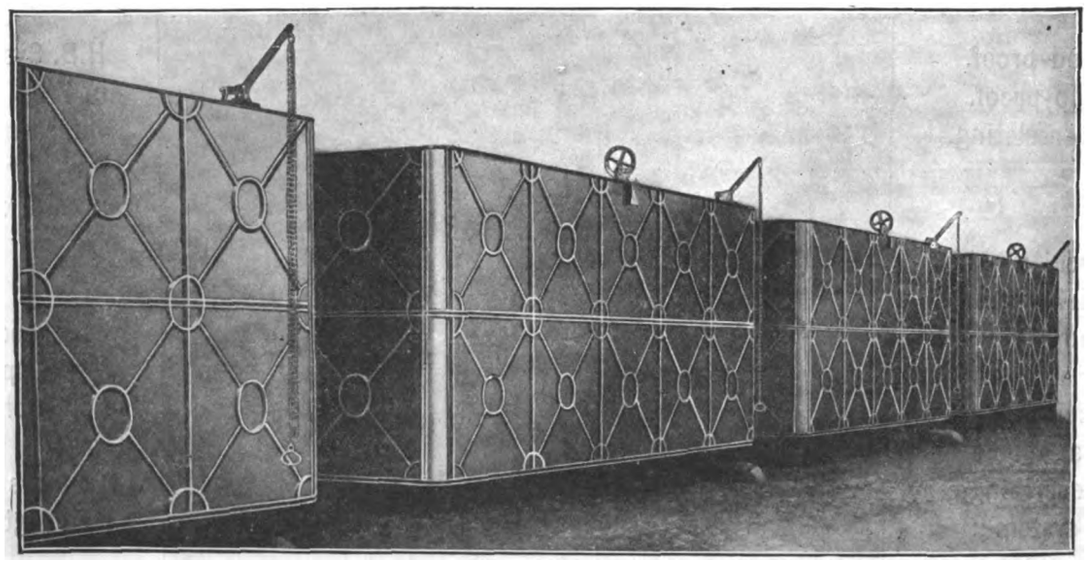
In the author's opinion, therefore, it is clear that hypochlorite sterilisation must be much more economical than ozone treatment, making every allowance for the price of salt.

As a result of the experiments and researches conducted up to the present time, several conclusions may be arrived at:—

(1) That the sterilisation of sewage in large quantities is practically and economically possible.

(2) That this may be most economically effected by careful use of chemically prepared hypochlorite at very small works, and at larger works, or works of moderate size, by the use of electrolytic hypochlorite.

(3) That such treatment may be given where required to tank effluents as will render them inoffensive, and that when necessary such effluents can be sterilised. This is of particular importance in the case of sea outfalls near fisheries or oyster-beds, where a very great saving might certainly be effected by sterilising a good tank effluent from which suspended matters were removed. Such an effluent could not possibly harm the fish, and the cost of filtration would be partly or entirely eliminated. There are many authorities which discharge their sewage into the sea or into tidal estuaries, whose difficulties would vanish if they clearly understood the possibilities of sterilisation.



(4) It is possible to remove clogging matter due to growths in filters or in sprinkling apparatus, by a strong dose of hypochlorite. This method of cleaning filters or apparatus may be regarded as important, and might be extremely important under certain conditions. It does not appear at present that any other treatment can compare economically with hypochlorite treatment, though, of course, the possibilities of cheapening other processes in the future should be borne in mind.

(5) That sterilisation of water by the ozone processes has now been adopted so largely as to leave no doubt as to its practical and economical possibility.

(6) That the sterilisation of water by means of electrolytic hypochlorite is also possible, and that though not generally adopted at present the system should be carefully tested, as it would apparently be a cheaper process. For this reason comparative experiments are desirable.

From the facts stated, it will be seen that there is abundant evidence that the cost of plant, labour, and chemicals in the hypochlorite process is not excessive, and when one remembers the enormous sums which have been cheerfully spent in the past on chemicals added to sewage for precipitation purposes, one is surprised that there should be such an outcry against expense where it is proposed to do so much less in order to obtain a result so much greater.

Telegrams: "Camelon, Falkirk."

NOW READY,

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says :—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest.

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my ectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

PUBLISHERS, GILBERT WOOD & CO. LTD.,

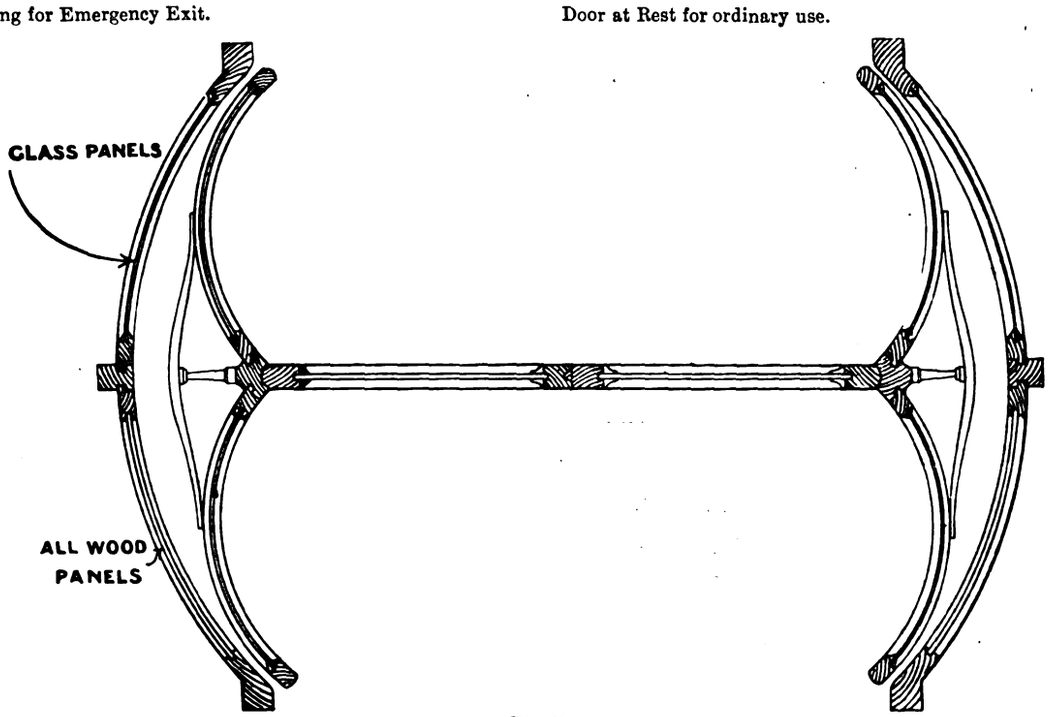
STRAND PALACE HOTEL.

SAMUEL ELLIOTT'S PATENT ANTI-CYCLONE (Two-Way) DOOR

has been fitted at the above Hotel. This is the first Two-Way Door fitted in the United Kingdom

Centre Doors opening for Emergency Exit.



Door at Rest for ordinary use.

Advantages. — Either section gives twice the amount of space available in any existing revolving door, all fear of the next division behind interfering with forward progress is eliminated.

Appearance. — It has a much better appearance and is architecturally infinitely superior to any of the revolving four-way doors on the market.

Position of Wings.—By the mechanical apparatus these always return to the sides, preventing the uneven appearance of the wings of other revolving doors.

Fire Exit.—The greatest advantage in the Gilmour Anti-Cyclone Door is situate in the fact that all other revolving doors require lever manipulation to dislocate the leaves in order that a rush of people can pass, and most of them leave the wings in the centre of the opening. With the Anti-Cyclone Door an entirely different method is adopted. The wings always resting at the side against the circular framing, the centre between the two wings is composed of a pair of doors which when pushed open outwards leave absolutely free egress to a crowd, this centre pair of doors being in effect a pair of exit doors entirely in accordance with the requirements of the London County Council for fire exit doors in theatres, music halls, &c.

PLAN

It is now generally known that the Prefect of Police in Paris recently condemned certain styles of revolving doors owing to several fatal accidents having occurred through the time taken in, and lack of knowledge of, releasing the said doors. This Anti-Cyclone Door, on the other hand, is permitted by the Paris Prefect of Police, and is being hung generally in that city, among the numerous buildings that have adopted it being: Maxim's, Rue Royale; Palace of the Quai d'Orsay; Universal Brewery, Avenue de l'Opéra; Clillon Hotel, Place de la Concorde (two doors); Louvre Hotel, Place de Théâtre Français; Bernot Frères & Co., Rue Lafayette; Crédit Lyonnais, the Largest Bank in France; Moulin Rouge, Place Clichy, and at 27 Boulevard Diderot. They are also fixed in many places at Nice.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

NEW CATALOGUE.

ALMOST if not quite the first form of glazing to supersede in skylight roofing the old unsatisfactory method of bedding the glass in putty was introduced more than a quarter of a century ago by Messrs. William Edgcumbe Rendle & Co., The form then devised has ben improved repeatedly, and now Rendle's "Invincible" system of glazing is, despite the efforts of numerous competitors, as good as, if not better, than any other. In the first place it is simple, in the next it is effective in excluding rain, and, though thus effective, makes provision for carrying off any water that might penetrate by reason of imperfect fixing or other trivial cause, as well as for any resulting from condensation of the internal atmosphere. Expansion and contraction of the glass or metal are also adequately provided for. Needless to say, Rendle's "Invincible" glazing has been extensively and successfully used in many important buildings, some of which are illustrated in Messrs. Rendle's latest catalogue. Two fine specimens of their latest work may be seen in London at Victoria Station, L.B. & S.C. Ry., and Waterloo Station, L. & S.W. Ry. The combined area of these roofs, when finished, will amount to nearly one million feet superficial. From an architectural point of view a more artistic piece of work will be that carried out by Messrs. Rendle of the roofs, galleries, and domes of the Victoria and Albert Museum, South Kensington.

THE "TILT" FIRE.

WITH THE "TILT" FIRE YOU CANNOT FAIL TO GET A BRIGHT FIRE IN A FEW MINUTES.

The tilting arrangement is so simple that there is nothing to get out of order. No other hearth fire has such advantages. Many hundreds already sold.

POINTS:—Clean Hearth.
Quick or Slow Combustion.
Saving of Fuel.

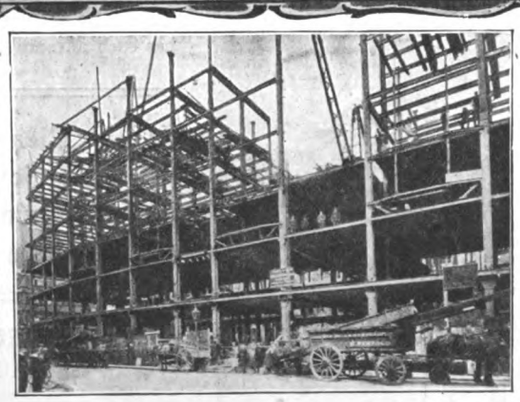
TRADE NOTES.

UNDER the direction of Mr. C. A. Downton, architect, Kidderminster, the "Boyle" system of natural ventilation, embracing the latest patent "air-pump" ventilators and air inlets, has been applied to Stourbridge School.

MR. WILLIAM BALDWIN, foreign representative, the Paraffine Paint Company, San Francisco, manufacturers of "Malthoid" and kindred building material, is due to arrive on September 16, per s.s. *Prinz Ludwig*, after an extended tour in the Orient.



THE General Electric Light Co., Ltd., 71 Queen Victoria Street, E.C., have undermined one of the few remaining objections to the use of electric light in small-sized houses, for their 17 watt Osram lamp is rated at approximate 16 h.c.p. and is calculated to give 20 hours' light for a penny.

The 40 watt (approximate 32 h.c.p.) Osram lamp gives twenty-five hours' light for the consumption of one unit of current. The lamp has an average life of over 2,000 hours, and during the whole of that period its initial candle-power is practically undiminished. The initial cost is higher than that of the ordinary carbon lamp, but this is amply counterbalanced by the saving on the current and durability. Our illustration shows the latest type of lamp, but it is also made in spherical form.

THE Associated Portland Cement Manufacturers (1900), Ltd., have issued their statement of accounts, which will be presented at their tenth ordinary general meeting on Thursday next. The directors recommend the payment of a final dividend on the preference shares to June 30, 1909, at the rate of 5½ per cent. per annum. The directors recommend that, as in previous years, a sum of 25,000*l.* be carried to the general reserve and depreciation account, bringing that account to 195,000*l.* The total charge for the year for sinking funds, depreciation and reserve (including the amount written off patents and the reserve for bad and doubtful debts) will then amount to 61,065*l.* 13*s.* 8*d.* The directors consider that in view of the condition of the building trade the year's trading is satisfactory. The selling price of Portland cement is substantially less than the cost of production a few years ago. The main factor which has enabled the company to earn approximately the same margin of profit on its output as heretofore is the reduction in manufacturing cost brought about by a very considerable outlay of capital upon its principal works. There should accrue during the current year a fuller economy from all this expenditure than has yet been realised.

In the brief description which was given last week of our illustration showing the large dining-room, Central Station Hotel, Glasgow, it was erroneously said that the marble work was carried out by Messrs. OSCAR PATERSON & Co., of Glasgow. This firm were responsible for certain decorative glasswork, as in the dome of the lounge. The contractors for all the marble work, which forms so prominent a feature of the additions to the hotel, should have been given as Messrs. GALBRAITH & WINTON, 185 St. Vincent Street, Glasgow, contractors for all kinds of constructive and decorative work in British and foreign marbles and alabaster.

ILLUSTRATIONS.

NEW WEST WING, TEMPLE DINSLEY, HERTS.

SELECTED DESIGN FOR BERKSHIRE COUNTY COUNCIL OFFICES, READING.

BUILDING AND BUILDERS.

MR. HAROLD S. SCOTT, architect and surveyor, 44 Waterloo Street, Birmingham, has been appointed architect for a vicarage to be erected at Skelmanthorpe, near Huddersfield, and has now got the plans in hand.

AN American theatrical syndicate are said to be about to erect large theatres at Fairfield, near Liverpool, Bootle, Birmingham and Nottingham. Negotiations are being carried on for sites in the last three towns, and have been completed in the case of Fairfield.

SWANSEA Board of Guardians have written to the Corporation, asking upon what terms a loan of 2,300*l.* could be arranged for additions to the workhouse. The Town Council will be recommended to offer the Guardians the loan of the money from the sinking fund at 3¾ per cent. interest.

MR. C. F. WIKE, the city surveyor of Sheffield, has prepared a scheme for an important street improvement whereby a thoroughfare 70 feet in width would be cut from Castle Street through a big block of low-class property to the Great Central Railway station. The building sites thus created would be all on Corporation land.

NANTWICH Urban Council have approved the terms arranged with Lord Crewe, by which Nantwich will acquire a new source of water supply from the neighbourhood of Wrinehill. Boring operations will be necessary. The cost will be 15,000*l.* The present supply at Baddiley, near Nantwich, has been condemned as being deficient in quantity and quality.

THE Glamorgan County education committee have decided in regard to the proposed training college for girls to be erected at Barry that accommodation shall be provided for 130 residential and twenty non-residential students, with the usual rooms for professors, &c. Originally it was intended that a college should only be provided for 100 students.

THE streets and buildings committee of Edinburgh Town Council on Friday considered an application by the Charlotte Baptist Chapel for permission to increase the height of their church in West Rose Street. The intention is to take down the present building and erect a new chapel. Rose Street is at present 30 feet in breadth, and it is proposed to increase the building to a height of 54 feet, being 24 feet in excess of the regulation height. This was opposed by adjoining proprietors, and the committee agreed to visit the site before coming to a decision.

AT a sitting of the Troon Dean of Guild Court on Monday petitions were presented and passed for the erection of property valued at 5,300*l.* as follows:—Provost Logan, tenement in Portland Street, estimated cost, 850*l.*; Messrs. M. Muir & Co., double villa in Harling Drive, estimated cost, 1,400*l.*; Mr. Gilbert Smith, double villa in Harling Drive, estimated cost, 1,400*l.*; Mr. Hugh Shaw, double villa in Harling Drive, estimated cost, 1,300*l.*; Mr. George Symington, Windyhaugh, for alterations and additions, estimated cost, 350*l.*

THE West Hartlepool Town Council are considering what prompt measures can be taken to put an end to the wholesale looting of empty houses in the town. In some instances little more than the shell of a house is left, flooring boards being ripped up, doors broken, and even staircases and fireplaces removed almost bodily. Windows, unless immediately boarded up on a tenant leaving, are riddled with stones, and even when houses are boarded up the boards are not infrequently pulled down.

MR. CHARLES CURTIS GRAY, surveyor to the Scunthorpe Urban Council, was charged at Scunthorpe with obstructing the highway by placing trestles with poles across and not having them lighted. The road was under repair at the time. Mr. Gray admitted that the lamps were not lit, and said the man to whom instructions had been given had failed to carry them out. He thought it was rather frivolous. The Chairman said they were sorry to have to fine Mr. Gray for the fault of a workman, but they could not see their way to let him off. Fined 5*s.* and costs.

THE plans committee of the Lower Ward of Lanark at their last meeting disposed of the following plans of new

buildings, etc.:—Robert Chapman, Coatbridge, alteration of dwelling-house on Chryston Road, Chryston; Shettleston Free Church, new church at corner of Wellshot Road, Shettleston; Thomas Begg, Glasgow, tenements corner of Wellshot Road and Woodend Place, Shettleston; George Nicoll, Chryston, cottages, Cumbernauld Road at Mollinburn; E. Roslyn Mitchell, Cambuslang, alteration of cottage, Hamilton Drive, Shettleston; J. A. Dixon Erskine, Glasgow, villa, Victoria Road, Lenzie.

THE Stockport Guardians have decided to build a one-storey brick sanatorium for twenty-four patients at Stepping Hill. The building is to comprise a central day or mess room, 32 feet long and 16 feet wide, with a nurses' kitchen attached. At each side of the day room is to be a ward to hold twelve beds, and on the southerly side of each ward an open verandah. The estimated cost of the building is about 80*l.* per bed, or a total of 1,920*l.*

THERE were twenty-three petitions before the Edinburgh Dean of Guild Court on the 9th inst. Six warrants were granted, including one to St. Cuthbert's Co-operative Association, Ltd., for the erection of a cattle depôt at Gorgie. The depôt will be to the north of the new slaughter-houses, and will extend to 180 feet by 150 feet. The building will contain stores for cattle and sheep, cooling rooms, despatch rooms, stables, and sheds for killing. The Lord Dean of Guild said he was very pleased to see the Association come forward with such a high-class building for a cattle shed.

ACCORDING to the thirty-fourth annual report of the Public Works Loan Board, the Commissioners during the financial year 1908-9 made 969 advances for sums amounting together to 2,714,068*l.* This amount includes the sum of 85,442*l.* advanced for providing dwellings for working classes. Among the bodies to whom loans were advanced were 4,150*l.* to the Fallings Park Garden Suburb Tenants, Ltd., 7,010*l.* to the Hampstead Tenants, Ltd., 2,277*l.* to the Garden City Tenants, Ltd., 18,335*l.* to the Harborne Tenants, Ltd., 13,396*l.* to the Ealing Tenants, Ltd., 5,500*l.* to the Letchworth Cottages and Buildings, Ltd., 8,907*l.* to the Manchester Tenants, Ltd., 1,122*l.* to the Fairfield Building Club, and 2,145*l.* to the Bedlinog Workmen's Building Club.

VARIETIES.

A PARISH hall is to be provided at Mill Hill, Hendon, at a cost of over 2,000*l.*, as a memorial to the late vicar.

APPLICATION is to be made by the Gillingham Town Council for a loan of 2,650*l.* for the extension of the Technical Institute.

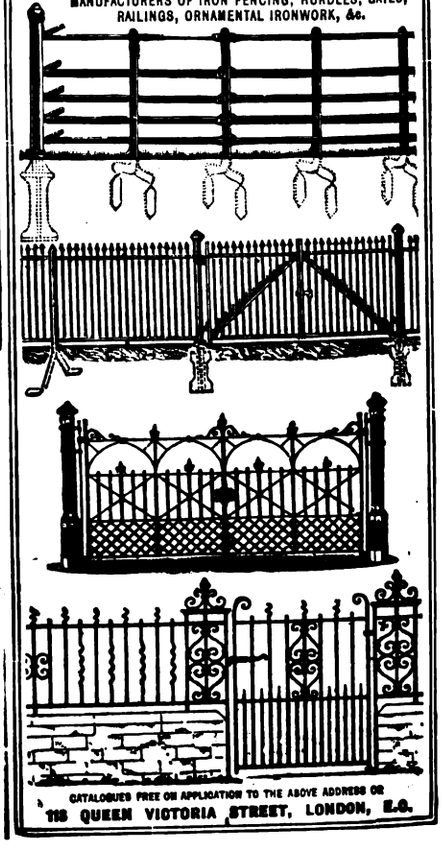
THE third International Congress and Exhibition of School Hygiene has been postponed at the instance of the French organising committee until August 2 to 7 of next year.

THE Wakefield education committee on Tuesday decided that application be made to the City Council for authority to purchase a site (4 acres) in Lawefield Lane at a cost of 1,500*l.* for an elementary school.

MESSRS. J. CHEAL & SONS, landscape gardeners, of Crawley and 53 Victoria Street, Westminster, have sent us a copy of the pamphlet they are just issuing, entitled "All for the Garden." Messrs. Cheal's nurseries have been so extended that they now cover 113 acres of ground.

THE Illuminating Engineering Society opens its first session in November, under the presidency of Professor S. P. Thompson, D.Sc., F.R.S. A representative Council has been formed, with Mr. L. Gaster, 32 Victoria Street, S.W., as honorary secretary.

A SCHEME has been set on foot in South Shields for the establishment of new free library buildings more in keeping with the size and importance of the borough than the existing premises in Ocean Road. Mr. A. Carnegie is to be approached with a view to obtaining the necessary funds.



ST. LUKE'S CHURCH, Bath, is to be considerably enlarged to meet the rapid development of the neighbourhood since the present structure was opened in 1868. The vicar (Rev. C. E. Doudney) is to call a meeting to appoint an architect to carry out the work. The cost is expected to be 5,000*l.*

THE annual meeting of the Sanitary Inspectors' Association, North-Eastern Centre, was held in the town hall, Sheffield, on Saturday last. By the invitation of Messrs. Newton, Chambers & Co., Thorncliffe Ironworks, near Sheffield, manufacturers of "Izol" disinfectant, the various processes were succinctly explained and the members were entertained to luncheon by the firm. Mr. R. Allison, Huddersfield, was subsequently elected honorary secretary.

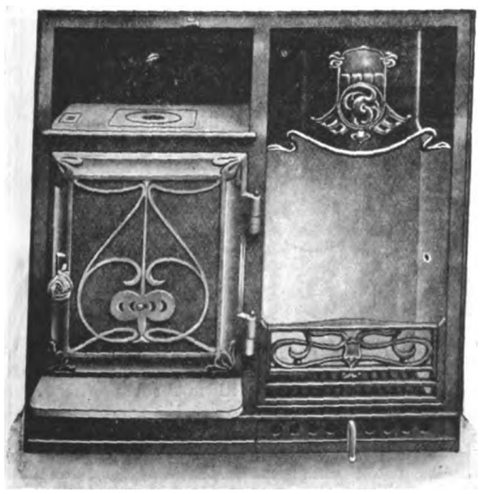
"ALONG THE GREAT WALL OF CHINA" forms the subject of an interesting and well-illustrated article by Dr. Geil, F.R.G.S., in *Harper's Magazine* for this month, which also contains a graphic description of the town of Barga, in Italy, with etchings by B. J. O. Nordenfeldt.

MESSRS. RAPHAEL TUCK & SONS, LTD., the well-known fine art publishers, have forwarded us specimen boxes of their latest novelty, "Picture Puzzle Postcards," which are adapted to form a pleasant pastime and sociable recreation for the long evenings of autumn and winter. The numerous sets issued comprise a large range of important and picturesque designs.

AT the last meeting of the Cheltenham Town Council the town clerk announced that the Leslie Young trustees had set aside 1,000*l.* for the Public Library and 1,000*l.* for the Art Gallery and Museum. An intimation that the Royal Institute of Public Health would be pleased to hold their 1910 congress in Cheltenham was referred to the general purposes committee.

THE Council of the Society of Engineers instituted a prize to be awarded for five years for the best essay on "How to Improve the Status of Engineers and Engineering, with Special Reference to Consulting Engineers." As a result of the first year's competition Mr. G. Allan Thomas, M.C.M.E.S., has been awarded the prize, and he will read his essay at the meeting of the society on October 4, at Caxton Hall, Westminster.

AT a meeting of the Derby Board of Guardians on Tuesday afternoon a sequel to the recent controversy in reference to the method under which specifications and quantities have been prepared and supplied was furnished in the report of the special purposes committee, who suggested that all copies of specifications and quantities should be obtained from the same impression, so that each might be identical, and that a copy thereof should be placed in the clerk's office for general inspection. The Board approved of this course.



A MODEL of the statue by Mr. F. W. Pomeroy, A.R.A., which is to constitute the town's memorial of the late Lord Burton, was on view at the town hall, Burton-on-Trent, last week. The proposed memorial is to consist of a pedestal of grey Scotch or Cornish granite 12 feet high, surmounted by a bronze statue of Lord Burton 9 feet in height, representing the late peer in his baron's Coronation robes over his uniform as hon. colonel of the old 2nd North Staffordshire Volunteers. Mr. Pomeroy was authorised to proceed with the erection of the statue.

PADDINGTON Railway Station is to be enlarged by the addition of three additional roads and platforms on the Bishop's Road side. The design adopted for the new roof is identical with that over the existing platforms, which is of the arch type, the main span being 60 feet from rail level. It is intended that the subway giving access to the different platforms, which extends from No. 1 to No. 8 platforms, shall be carried under the new lines. The present exterior wall of the station will have to be underpinned and dropped to a lower level. This preparatory work will occupy twelve months. The enlargement scheme is being carried out under the superintendence of Mr. W. Armstrong, engineer for new works to the Great Western Railway, Mr. J. C. Wright acting as resident engineer.

MR. HENRY J. WILSON recently asked the President of the Local Government Board whether his attention had been drawn to the fact that during the last eight years the Coal Smoke Abatement Society had made 3,222 complaints to the West Ham Corporation of the emission of black smoke from the factories within the area of the Corporation without that authority taking legal action in any instance. Mr. John Burns replied as follows:—"I am aware that the society has made numerous complaints to the Town Council on this subject. The latter have, I understand, served a number of notices calling for abatement of the nuisance; but I do not gather that they have proceeded for penalties before the justices. The Local Government Board have, from time to time, brought this matter before the notice of the Town Council. The Board are not empowered to take upon themselves the powers and duties of a local authority who have made default in relation to nuisances under the Public Health Act, 1875, but they could authorise an officer of police acting in the district to institute proceedings if the default of the authority was proved to their satisfaction. Any officer so appointed, however, would have no greater power to take action than is conferred by the Act on any person aggrieved by the nuisance, or any inhabitant of the district, or any owner of premises within it."

STRAND PALACE HOTEL.

THIS recent addition to the hotels of London has been erected upon the sites of the old Exeter Hall and St. Michael's Church adjoining, occupying an area of 20,000 square feet. The site has frontages to four streets.

The façades of the building are faced with Doulton's Carrara ware, and the roofs covered with green Westmoreland slates.

The main entrance is in the Strand, and leads into a lounge which runs through to the winter garden. Owing to the enormous traffic in the Strand the arrival and departure door has been placed in Exeter Street, W., with a luggage entrance, receiving room, and lift adjoining. Between this entrance and the lounge is the booking and inquiry bureau. The staff and goods entrance is situated on the eastern side of the hotel in Burleigh Street.

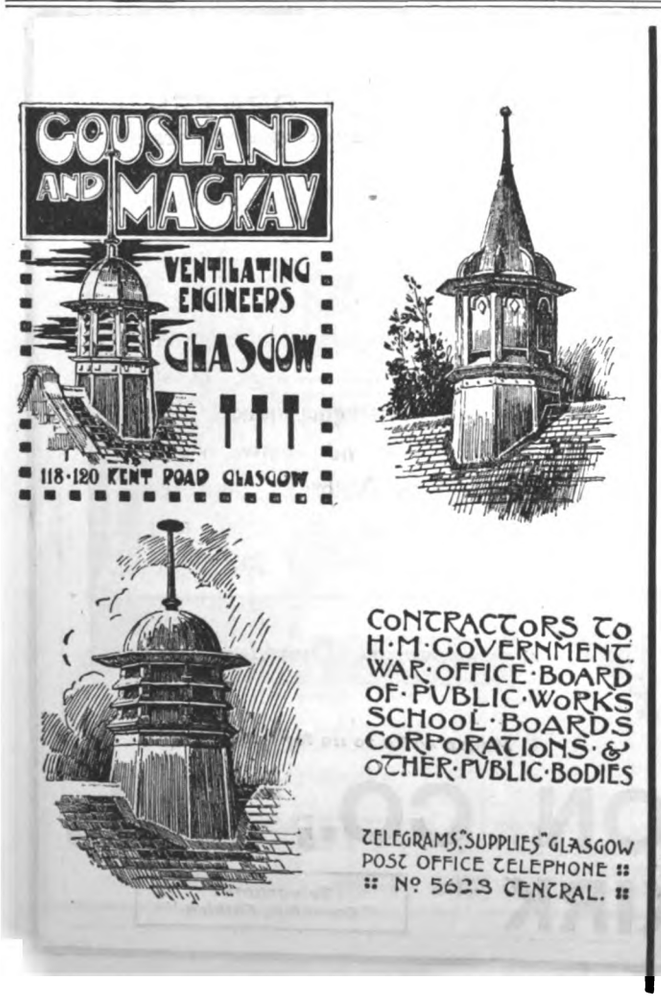
On the ground floor there is a fine winter garden 130 feet long by an average width of 35 feet. It has two glazed domes each 30 feet in diameter, above which are square courts running the whole height of the building and affording light and air to the interior bedrooms. These courts are connected with the streets by means of ducts immediately below the second floor, and a constant current of air will thus be obtained. From the winter garden the main dining hall 94 feet by 59 feet, drawing room 40 feet by 31 feet, and writing room 16 feet by 31 feet are reached.

A large portion of the basement is devoted to the grill room, the smoking room, and the billiard room. The grill room, situated under the winter garden, is reached by a double stair from the Strand entrance hall, and from the winter garden by a staircase and passenger lift. It can accommodate 800 diners simultaneously. The rest of the basement is occupied by toilet rooms, kitchen, larders, cellars, service staff, engine and boiler rooms.

On the nine upper floors 470 double and single bedrooms have been provided, each containing a marble washstand fitted with hot and cold water.

Each floor is served by a separate express food service lift, two passenger, one staff, and one luggage lift.

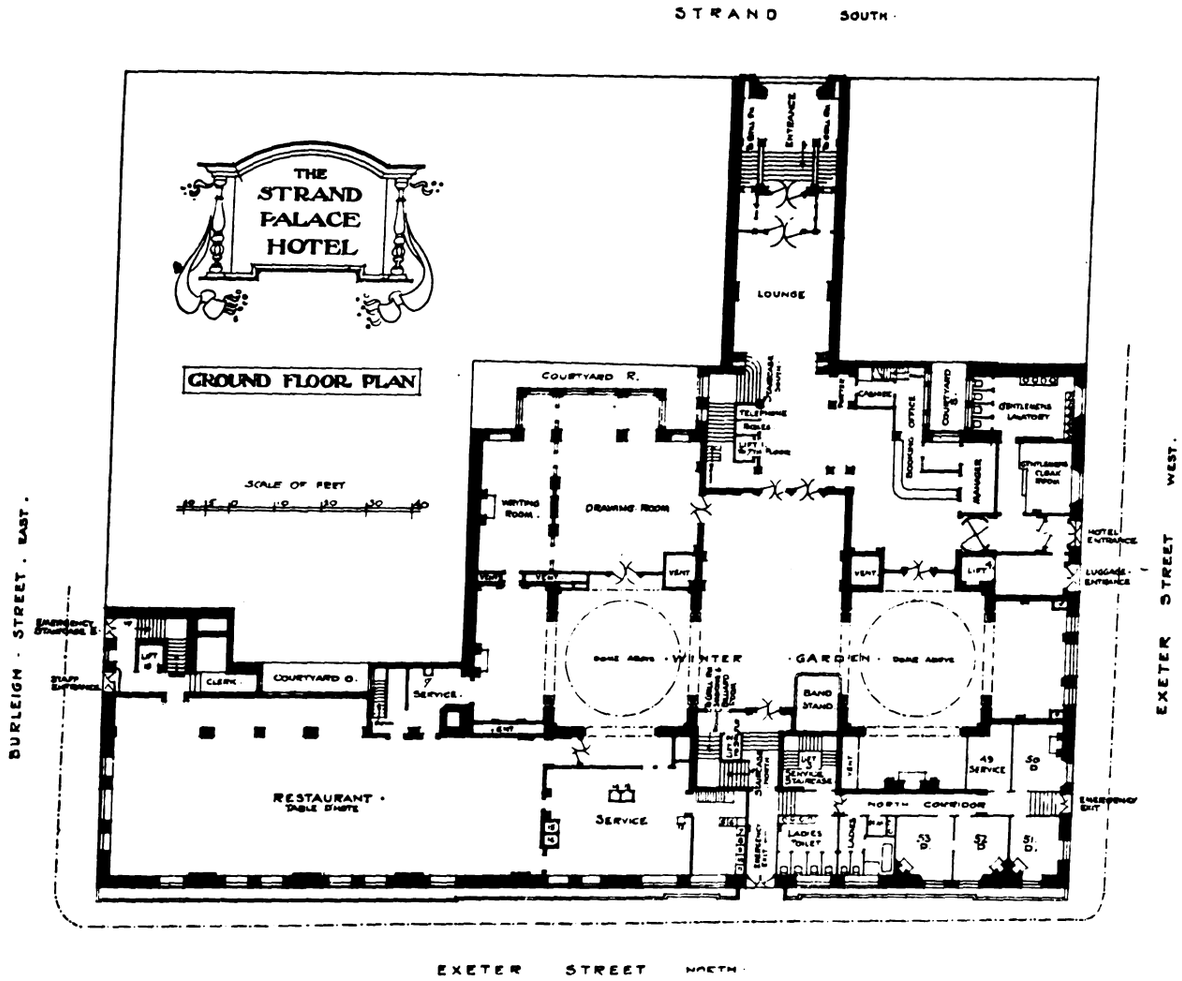
The storage water tanks and water softening plant are in the roof, which is of the Mansard type.



The general system of heating and ventilation throughout the ground floor and basement of the hotel is the Plenum. The corridors on the bedroom floors are warmed by hot-water radiators. A large vitiated air shaft 6 feet square, with electric exhaust fan at top, forms part of each block of lavatory accommodation, and is so designed as to prevent the escape of any vitiated air into the corridors.

The architect is Mr. W. J. Ancell, of 3 Staple Inn, W.C., with Mr. H. Tanner, jun., F.R.I.B.A., of 12 Regent Street, S.W., coadjutant.

The general contractors for the building were Messrs. Leslie & Co., Ltd., of Kensington Square, W. The following were some of the principal sub-contractors:—



Steelwork, Dorman, Long & Co.; heating and ventilation, J. Jeffreys & Co.; electric light wiring, Strode & Co.; marble work, H. & T. Jenkins, Garston Frères, of Belgium; decorative plaster work, the Bromsgrove Guild, Campbell, Smith & Co.; general plaster work, Wheater & Son; lead glazing, the Bromsgrove Guild; shelters, the Bromsgrove Guild, Jones & Willis; staircase enclosures, Jones & Willis; lifts (electric and hydraulic), Waygood & Co., Ltd.; stoves, Albion Iron Co., Messrs. Elsley; Carrara ware, Doulton & Co.; furniture, the Bath Cabinet Makers; mosaic paving, Diespeker, Ltd., the Art Pavements and Decorations Co., Ltd.; sanitary fittings, Doulton & Co.; lightning conductors, G. W. Gray & Son; electric light fittings, Strode & Co., General Electric Co., Burt & Co.; hydrants and water supply, Mather & Platt; ironmongery, Gibbons, Carter & Aynesley, Bromsgrove Guild; wall tiling, Wooliscroft; roof glazing, the Standard Glazing Co., Ltd.; plumbing, Dent & Hellyer; domes to winter garden, the Bromsgrove Guild; ground-floor doors, the Bromsgrove Guild; revolving door, S. Elliott & Co., Reading.

The building is up-to-date in every detail, and in none more so than in its system of lifts, which was installed by Messrs. R. Waygood & Co., Ltd., London. There are two main passenger lifts, each capable of carrying a load of 10 cwts., or seven persons, at a speed of 300 feet per minute. They are specially designed for smooth running at high speed, and with special controlling arrangement so that they can be started and stopped with smoothness and accuracy at the various levels. One of these lifts is worked by hydraulic power from

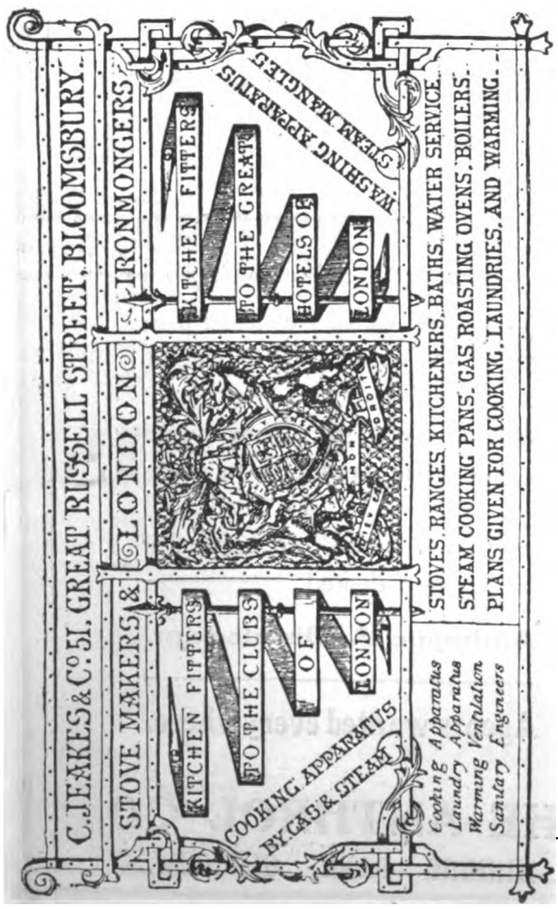
the high-pressure main of the London Hydraulic Power Company, and the other one by electric power, the latter being arranged with winding gear and special electrical control with car switch in the cage. Special electrical indicators are also fitted on each lift showing the position of each at every floor by means of ornamental fitting with electric light. The guides run on round steel runners so as to give the smoothest possible travel. The cages are handsomely finished and decorated, and are provided with special safety apparatus to prevent the descent of cage in case of suspension ropes failing, also safety appliances to guard against over travel in either direction.

There are two goods lifts travelling up through the building, one operated by hydraulic power, and capable of carrying loads of 15 and 20 cwts., and one direct acting platform lift from basement to ground floor.

There is a very complete installation of electric service lifts—fifteen in number—serving the various floors and operated by push-button control with automatic stopping at each end of travel. There are also three small hand-power lifts for carrying wine and papers respectively.

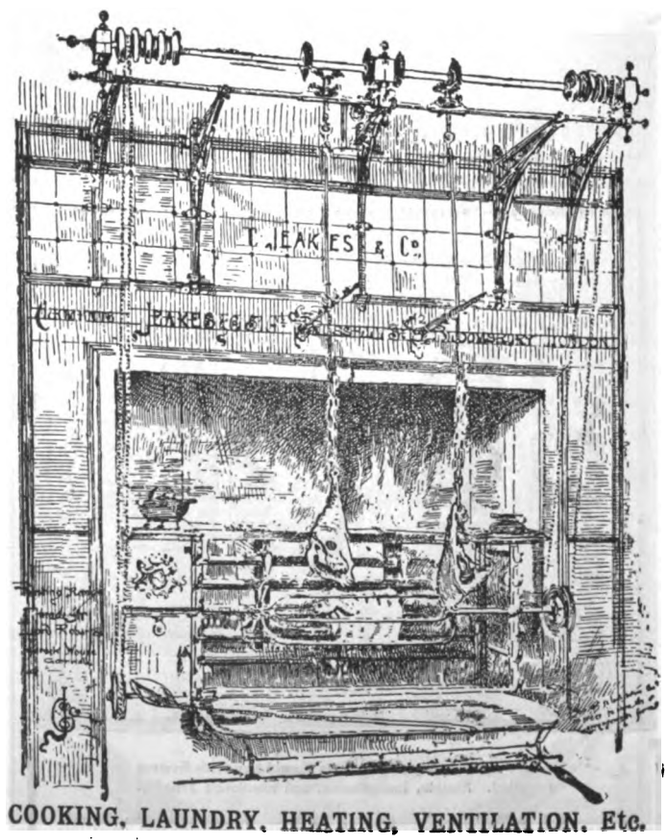
One of the most interesting structural novelties is the "Anti-Cyclone" (two-way) door—Samuel Elliotts' patent—supplied by the Gilmour Door Company. No doubt many of our readers will remember having seen it at the recent Building Trades Exhibition, where it aroused considerable attention. It differs in some important respects from the ordinary revolving door. In the first place the usual four sections are reduced to two by the elimination of one pair of cross-doors. The wings always return to the sides when the door is at rest, so giving the appearance of the customary swing-to doors. But of greater importance is the fact that the two central or diametre doors open on a very slight pressure from within, and, fitting against the sides, leave an unimpeded passage for the crowd to pass through. The fact that the door has been fitted in the Strand Palace Hotel is proof that it meets the stringent requirements of the London County Council as to fire exit doors.

Messrs. Doulton & Co., Ltd., supplied all the sanitary fittings. A special feature is that a lavatory basin fitted with hot and cold water is fixed in each bedroom. These basins are in polished Jaune Lamartine marble, with nickel-plated legs. There is also a nickel-plated towel rail fitted with a glass shelf, etc. The baths are made of cast iron white porcelain enamelled inside and outside, with nickel-plated fittings. The w.c.s are the pedestal type; the cistern, flush-pipe, and pan are all in white glazed ware. The lavatories for public rooms are in Dove marble with waste of special design. The urinals and the sinks are in Doulton's special white glazed vulcanware.



THE plans for a new theatre to be erected in High Street, Leek, which were submitted by Messrs. Williams & Co., have just been approved by the local authority.

MESSRS. LONGLEY & Co., Crawley, have received the contract from the London and Brighton Railway Company for the reconstruction of Worthing Station.



THE Sheffield Master Builders' Association at their monthly meeting last week presented to Mr. A. Mastin a handsome carved oak Westminster chime-clock, in recognition of his valuable services as treasurer of the association for a period of ten years.

THE Tynemouth Town Council are recommended to expend 6,000*l.* on the provision of larger mains and feeds for the improvement of the supply of water to Whitley and Monkseaton. A report has been prepared by Mr. J. F. Smillie, the borough surveyor.

MR. AUSTEN CHAMBERLAIN, M.P., has replied as follows to a letter from the Institute of Clay Workers setting forth the injustice of treating common brick clay as a mineral for the purpose of the Finance Bill:—"I share your objection to the Chancellor's latest tax on British industry. Not only is the clay worked by you to be taxed, but your coal will also have been taxed, and thus a double burden is to be placed on raw materials. Other industries are equally affected in their raw materials, and thus the cost of home manufactures is to be raised, whilst the foreigner is encouraged to send his productions into this country free of tax to compete with British labour and capital. This is the final triumph of Free Trade finance. I shall certainly do my best to defeat these monstrous proposals. Tariff Reform offers a better way of raising the necessary revenue and at the same time assisting British industry instead of fining it."

PUBLIC WORKS AT HAMBURG.

THE Hamburg Government is, according to the last report of the British Consul, indefatigable in its efforts towards improving and enlarging the accommodation and arrangements of its already very extensive harbour, so that it may keep pace with the annually increasing amount of shipping visiting this port as well as with the increased dimensions of the majority of steam vessels which trade between this and other parts of the world.

Amongst other works the extension of the quays and harbours built for and leased to the Hamburg-American Line is contemplated, and in the meantime provisional accommodation is to be provided for the rapidly growing fleet of this company in the vicinity of the Kuhwärder Harbour. Two large new suction dredgers are about to be purchased by the State of Hamburg for dredging work in the River Elbe. It is further intended to construct additional extensive shelters for the dock labourers upon the same system as those already in use, which serve more especially for workmen taking their meals in bad weather.

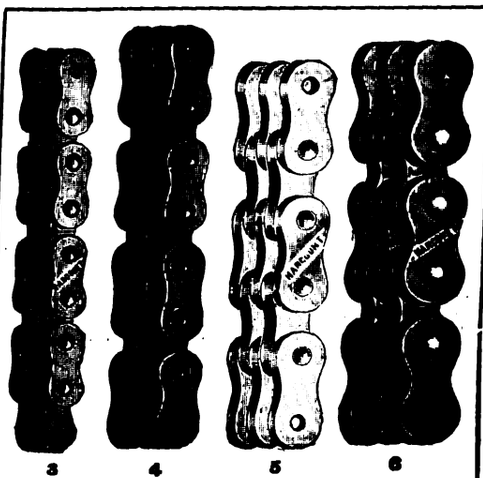
According to the Hamburg State Budget for 1909, the total sum to be set aside for the maintenance and improvement of the port during the present year is about 742,750*l*. Of this amount 270,200*l*. are for ordinary and 472,550*l*. for extraordinary expenses. Amongst the latter are comprised 160,000*l*. for continuing the construction of the tunnel underneath the Elbe, 185,000*l*. for building two new large quay sheds, and 35,000*l*. for two smaller quay sheds. For the completion of the new landing stages a sum of 47,500*l*. is required. In the amount set aside for the ordinary expenses is included a sum of 22,850*l*. for the outport of Cuxhaven.

The Elbe tunnel, which was commenced in 1906, will probably be finished in the year 1911; the total cost will probably exceed 400,000*l*.

Other public works of considerable importance (apart from those connected with the port of Hamburg already referred to) are at present being carried on in this town; among these is the construction of a circular and suburban railway, partly underground and partly elevated, intended more especially for the benefit of the industrial classes, who will thus be able to reach their dwellings in distant suburbs quickly at a cheap rate.

These works have necessitated the demolition of a very large number of streets and houses in some of the most densely inhabited parts of the town, but their disappearance will no doubt contribute towards making the town more healthy, and several fine wide streets will take the place of the old narrow ones which have disappeared.

The erection of almost palatial buildings for business offices in all parts of the town of Hamburg, which commenced about ten years ago, still continues undiminished, and has, it may almost be said, given a special feature to the business quarter of the town. It is, moreover, a characteristic of these office buildings that almost everyone shows a distinctive architectural style.



In another part of his report, in speaking of the British Patent Laws, he says the provision of the British Patent Law of 1907 obliging the owners of British patents who live outside the United Kingdom to work the patent in that country to a certain extent has caused a good deal of dissatisfaction in this and other parts of Germany. The Hamburg Chamber of Commerce considers it very regrettable that the German Government was unable before the new Patent Law came into force to conclude an agreement with the United Kingdom of the same nature as that concluded with Switzerland and Italy concerning the working of patents. The Hamburg Chamber of Commerce, however, points out that in Germany, where similar legal provisions as to the working of patents have existed for some time, but have so far been put into force only in a very lenient manner, this will perhaps in future not continue to be the case, if the British law in question should be actually carried out in a rigorous way.

DEVELOPMENT BILL AND OPEN SPACES.

THE following is a copy of a communication addressed to the Chancellor of the Exchequer by the Commons and Footpaths Preservation Society, 25 Victoria Street, Westminster, urging the need for the insertion in the Development Bill of a provision to safeguard commons and open spaces. The possible interference with such land if the Bill passes into law in its present form is viewed with much anxiety by the open space societies:—

WILLESDEN UNDERLINING
FOR ALL CLIMATES. PAPER WATER-PROOF. ROT-PROOF. INSECT-PROOF.

Development and Road Improvement Funds Bill, 1909.

Sir,—I am directed to draw your attention to the fact that the powers conferred by the above Bill as presented to Parliament may have a serious effect upon the preservation of commons and open spaces.

Under Clause 4 of the Bill any land (and therefore common land) can be taken compulsorily and without reference to Parliament for any of the various purposes specified in Clause 1 (1); and under Clause 9, and the Schedule to the Bill, motor roads can be made through open spaces, and building land can be acquired compulsorily by the side of these roads by means of a Treasury order, which operates without confirmation by Parliament.

During more than forty years the principle has been repeatedly affirmed and consistently upheld by Parliament that common land and open spaces shall not be appropriated for any purpose (however useful) other than that of ministering to the recreation and enjoyment of the public, except with the express sanction of Parliament in the particular case. This principle has been recently confirmed in the most explicit manner in the case of the pending Housing and Town Planning Bill, in which a clause completely satisfactory to the open space societies has been inserted on the motion of the President of the Local Government Board. I forward for your consideration an adaption of this clause to the procedure contemplated by the present Bill.

The reasons that make it desirable that no appropriation of any open space should take place without the knowledge and sanction of Parliament are, if possible, stronger in the case of the Development Bill than in that of the Housing Bill. It is unlikely that any but small portions of common land would be taken for housing purposes. But schemes of afforestation and reclamation might affect large areas of common land. It has been found in the past that, however desirable such schemes may appear on the surface, the destruction of common rights and the consequent disturbance of the rural economy of the district has resulted in the disappearance of small holdings, the crushing out of the class of small farmers and stock-keepers, and the general lowering of the status of the working agricultural population.

Afforestation or reclamation would be tantamount to inclosure, and inclosure is now universally condemned.

There may, no doubt, be exceptions to the general rule, but such exceptions should only be made with the express sanction of Parliament given after full knowledge of the particular circumstances. The decision of a question so important in its social and economic results should not be withdrawn from the elected representatives of the people.

Similarly, a motor road carried through the heart of a common, with broad building frontages on either side, would in most cases, destroy the value of the common for purposes either of recreation or of grazing, the severance being as detrimental as the actual absorption of land.

There would, indeed, be a temptation, as the Bill stands, to promoters of schemes to choose common land for their purposes, as owing to the divers interests in such land it can always, under the provisions of the Lands Clauses Acts, be acquired more cheaply than land in private ownership. For this reason railways were formerly constructed through commons wherever the opportunity occurred; and it was only owing to the intervention of the House of Commons at the instance of the Commons Preservation Society that this serious injury to the public was arrested.

If, however, a small portion of common land, or any other kind of open space, is urgently required for a scheme under the proposed Act, the clause which I enclose would enable an exchange suitable to the object in view to be arranged.

The open space societies feel sure that His Majesty's Government have no desire to confer upon the public the benefits designed by the Bill at the expense of land already dedicated to the public use, but rather to increase the interest of the State and the public in the lands of the country. They therefore express their earnest hope that you will prevent any miscarriage of the intention of the Government by inserting in the Bill some such clause as that which I forward.—I am, Sir, your obedient servant,

LAWRENCE W. CHUBB, Secretary.

THE Fareham Urban District Council have approved plans prepared by the surveyor for a new fire station and public lavatories in West Street. The estimated cost is 1,100*l*. The surveyor has been instructed to prepare the necessary detailed plans, specification and estimates for submission to the Local Government Board.

From top to bottom of a House

Hall's Distemper is the quickest, cleanest and most healthful form of decoration, as well as the one which conforms most to the requirements of modern fashion and good taste.

Hall's Sanitary Washable Distemper

(*Trade Mark*)

makes beautiful washable walls.

It is applied with a white-wash brush, disinfects, and destroys all microbes, dries like flat paint, and sets hard as cement. It contains no lead and therefore does not discolour or turn black, nor crack, scale or peel off. Made in two qualities for inside and outside work.

The modern style of Decoration with Hall's Distemper walls, with Picture Rail, "Sisco" White Japan for the woodwork, and Hall's Distemper frieze is in popular demand. It is a quick and money earning decoration, and makes highly satisfied customers.

Please apply for sample shade-card and full particulars to the Sole Manufacturers—

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable substance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

Telephone No. 4725 Holborn.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

WOMBWELL.—Oct. 1.—For enlarging the premises of the Wombwell Working Men's Club and Institute by the erection of a billiard room, &c. Mr. Jno. Robinson, architect and surveyor, Park Cottage, Wombwell.

THE tunnel constructed for the purpose of conveying water from the Derwent Valley into the Rivelin for the improved corporation supply to Sheffield has been pierced. The work was commenced in July, 1904. It was decided to drive the tunnel from each end, to meet in the middle, without shafts. It is 6 feet by 6 feet 6 inches in diameter, and the total length, when it is completed, will be 7,623 yards, or 4½ miles. It is the longest tunnel of its kind in the United Kingdom, and the cost up to date is put at 136,000*l.* An extra expenditure of about 14,000*l.* will be necessary before the work is complete.

THE Southwark Borough Council have instructed their engineer to proceed with the necessary preliminary works for the construction of subways at the Elephant and Castle, for which powers had been obtained in the London County Council (General Powers) Act, 1909. The estimated cost of the subways is 15,000*l.*

NEW CATALOGUE.

WE have received from the Electric and Ordnance Accessories Company, of Aston, Birmingham, their list of electric cooking and heating apparatus. Gradually electric power is coming into use for heating purposes, and in course of time there is no doubt that it will be used extensively in private houses for cooking purposes. The tables given in the catalogue will give some idea as to the probable cost.

AT Sheffield last week an important conference was held to consider the question of smoke abatement, at which were representatives of municipalities, manufacturers, and societies from various parts of the country. It was agreed first:—"That a provisional committee, with power to add to its number, be and is hereby appointed to consider the best means of promoting a strong national movement for furthering smoke abatement, and to carry on such work till a permanent organisation can be formed, and that it be the first duty of such committee to organise a deputation from the principal towns in the north, and others, to wait upon the President of the Local Government Board, and that the whole of the delegates present constitute the committee named in the resolution." At a later meeting it was agreed by twenty-three votes to three to form an association, and to leave it with the executive to report as to the most suitable name and the scope of the society's work. The minimum subscription was fixed at 2*s.* 6*d.* a year. It was further agreed to communicate with all the large provincial cities and towns and suggest the formation of local committees.

TRADE NOTES.

THE Gilmour Door Company, Ltd., 51 Berners Street, W., supplied over 800 pine doors to the Strand Palace Hotel, London, in addition to the Samuel Elliott's patent anti-cyclone (two-way) door, to which reference was made in our description of the building which appeared last week. The Gilmour Door Co. have in the past few years booked some exceptionally large orders from all over the world, including 1,700 birch doors at the Windsor Hotel, Montreal, 984 oak doors at the Manchester Infirmary, 518 oak doors at the Imperial Hotel, Bloomsbury, and 1,197 doors at the Royal Alexandra, Winnipeg.

MESSRS. ALEXANDER RITCHIE & Co., LTD., inform us that they executed the exterior wrought-iron railings of the new Strand Palace Hotel, noticed in our last issue, and for which the architects were Mr. W. J. Ancell, of 3 Staple Inn, W.C., and Mr. H. Tanner, jun., F.R.I.B.A., 12 Regent Street, S.W., co-adjutant.

THE familiar poster of Messrs. Ripolin, Ltd., showing four house painters busily at work—the first on the house front, the second, third and fourth on the back of the man immediately in front—has been adopted by the *Sunday Chronicle* as a political cartoon. The Budget is first in the line, while Lord Rosebery, who walks behind, is painting "Revolution" across his back. Then comes Mr. Asquith, deeply engaged in painting "Futility" on the back of his lordship's coat; and last is Mr. Arthur Balfour, who, with dripping brush, stands ready to begin on Mr. Asquith.

MESSRS. PATMAN & FOTHERINGHAM, LTD., builders and contractors, 100-102 Theobald's Road, W.C., are making extensive alterations (Mr. Eustace Haynes, architect) to the premises of the General Electric Light Co., Ltd., of Queen Victoria Street, E.C. They have also just secured the contract for re-building 220-222 Great Portland Street, W., of which the architect is Mr. Claude W. Ferrier, 11 Waterloo Place, W.

THE Croydon Town Council have decided to apply to the Local Government Board for sanction to raise a loan of 10,800*l.* for additions to the borough hospital for infectious diseases.

BUILDING AND BUILDERS.

A NURSES' home is to be erected at the Epsom Workhouse and alterations carried out at the Middle House at a cost of 1,450*l.* and 150*l.* respectively. The plans have been prepared by Mr. A. C. Williams.

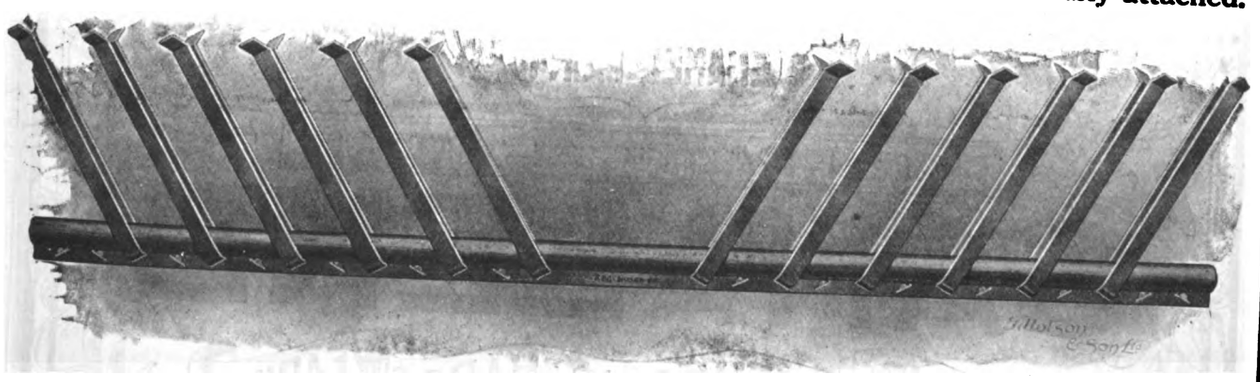
MR. J. T. MAY, of Eastern Esplanade, Broadstairs, builder and contractor, and proprietor of the Carlton Hotel, Broadstairs, left estate of the gross value of 32,173*l.*, of which the net personalty has been sworn at 2,838*l.*

MR. THOMAS BARNSLEY, of Augustus Road, Edgbaston, Birmingham, a past president of the Master Builders' Association, who died on June 19, aged seventy-eight, left estate valued at 79,972*l.* gross, with net personalty 37,895*l.*

MESSRS. WILLCOX & RAIKES, civil engineers, have prepared a sewerage scheme for Hanford which is estimated to cost about 5,000*l.* The Stone Rural District Council are to apply to the Local Government Board for the necessary loan.

THE Falkirk Dean of Guild Court have approved the plans submitted by Cross's Chemical Co., Ltd., Camelon, Falkirk, providing for the erection of an oilcake mill at their works in Camelon. The building will be a three-storey one, and of a specially strong nature for the heavy machinery to be installed.

HAMILTON U.F. Presbytery, N.B., have selected plans for a church at the corner of Gavin Street and Adele Street, Motherwell. The estimated cost of the building is 4,000*l.* The church is to seat 600, and a hall is to be provided giving accommodation for nearly 300, together with a session house seating 75.



THE Local Government Board have written to the Newton Abbot Urban Council sanctioning loans for 4,600*l.*, for the provision of a cemetery in Totnes Road and the widening of the road, 24 years being the period fixed for repayment of 3,470*l.* for the cemetery buildings, whilst sixty years was allowed for the amount for the land. The Surveyor hoped to have the working plans and specifications ready for inviting tenders in about seven weeks.

AT Glasgow Dean of Guild Court on the 16th inst. a lining was granted to the Corporation to erect additional slaughter-house accommodation at Moore Street Market at an estimated cost of over 45,000*l.* Other linings granted were to the North British Locomotive Co., Ltd., Hydepark Works, to

Avoid uncertainty and worry by insisting on your Concrete being reinforced with

The PERFECTOR TRUSSED BAR

the only Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.

The only system which is proof against the carelessness of workmen.

The Perfector Bar Reinforced Concrete Co.,

alter and add to premises in Ayr Street and Flemington Street, Springburn; to Elizabeth Bellord, Everton Valley, Liverpool, and others, to add to their training college in Victoria Crescent Road, Dowanhill; and to James Templeton & Co., carpet manufacturers, to alter and add to premises in West Street, Calton.

IN connection with the inclusion of common brick-clay among the minerals included in the Finance Act, some correspondence has taken place upon this subject between Messrs. Harwards & Evers, solicitors, of Stourbridge, and Mr. Cecil Harmsworth, the M.P. for Mid-Worcestershire. Messrs. Harwards & Evers have written to Mr. Harmsworth calling attention to the case of the Great Western Railway Co. and Blades, with which they were connected, which seems to deal directly with the matter under dispute. In this case it was held that common brick-clay was not a mineral within Section 77 of the Railway Clauses Consolidation Act, 1845. The solicitors continue:—"In his judgment, the learned judge found that in this district these clays are, in fact, the land itself, and 'not a thing which has a value of its own apart from the soil in which it is found, for the simple reason that it is the soil itself.' Under these circumstances we venture to think that so far as this part of the world, at any rate, is concerned, to treat this brick-clay as a mineral would inflict a great deal of hardship. Could you mention this matter to Mr. Lloyd George?" The hon. member for Mid-Worcestershire has replied as follows:—"I shall be most happy to bring the matter of the brick-clay in the Stourbridge district to the notice of Mr. Lloyd George, with a view to its being exempted from the operation of the minerals duty under the Finance Bill."

AN informal meeting connected with the building and auctioneering trades was held at the Church Institute, Tooting, on Tuesday, with the object of arranging for a future meeting at which the evil effects of the proposed Budget would be submitted to a larger audience of labouring men. The following resolution was passed:—"That this meeting of building estate developers and builders emphatically protests against, and pledges itself strenuously to oppose by all constitutional means, the land taxation proposals in the present Budget, being unanimously of opinion that such proposals have already caused an alarming increase in unemployment in the building and allied trades, and that if these proposals become law they will not only cause entire paralysis and stagnation in trade, where employment is already far below normal, but will occasion the dismissal of many old and trusted employés and workmen." The principal speaker stated that under normal circumstances eighteen firms in that district employed 5,014 men. At the present time they were employing only 2,379, a decrease of 2,635, or about 53 per cent. The builders' merchants were proportionately affected.

VARIETIES.

THE desirability of providing a pavilion at Rothesay is again under discussion, and it is expected that a scheme will materialise.

THE Bridlington Town Council have decided to purchase property at the north end of St. John Street for widening the thoroughfare and to construct lavatories and lay out a garden, at a cost of about 3,800*l*.

THE surveyor to the Atcham Rural District Council has submitted plans for the Pontesbury sewage scheme, the estimated cost of which is 2,469*l*. 6*s*. 3*d*. The scheme is under consideration.

THE Society of Engineers will hold a meeting on Monday, October 4, in Room 18, Caxton Hall, Westminster, when a paper will be read on "The Status of the Engineering Profession" by Mr. G. Allan Thomas.

THE public health committee of the Belfast Corporation have approved the plans for a new disinfecting station. Application will be made to the Local Government Board for authority to borrow the necessary money for the building.

THE Exmouth Urban District Council have decided to take the necessary steps to promote a Bill in Parliament in the ensuing session for carrying out the Dotton water scheme recommended by Messrs. Hill & Sons.

THE Higher Education Board of the eastern district of the Isle of Man have prepared a scheme for a secondary school and playing fields, to cost 20,000*l*., and for a new school for the Douglas district to accommodate 300 children at a cost of 13,000*l*. to 15,000*l*.

ILLUSTRATIONS.

SELECTED DESIGN FOR THE EXTENSION OF TOWN HALL, GRIMSBY.

OXFORD COLLEGE SERIES, BRASENOSE.—FROM HIGH STREET—CHAPEL QUAD.

GARDEN FRONT OF HEATHCOTE, ILKLEY, FOR J. HEMINGWAY, ESQ.

THE Worcestershire County Council have adopted a recommendation that 18,500*l.* be borrowed from the Public Works Loan Board at 3½ per cent. for the erection and fitting up of the King's Norton secondary school buildings.

THE Medway Board of Guardians have approved of an estimate of 400*l.* for premises to be erected in the workhouse grounds for the purpose of corn-grinding by the casuals. It is expected that this labour will considerably diminish the number of casuals.

THE Petersfield Rural District Council have adopted a scheme of sewerage and sewage disposal for the parish of Liss, Hampshire, prepared by Mr. Harry W. Taylor, A.M.I.C.E. (Messrs. Taylor, Wallin & Taylor), of Newcastle and Birmingham, which is estimated to cost 4,000*l.*

THE Chislehurst Council last week placed the contract for the Perry Street sewer with Messrs. Muirhead & Co., of Queen Victoria Street, London, at a price of 340*l.* Sixty tenders were received from places as far away as Edinburgh, and they ranged from 200*l.* to 877*l.* 12*s.* 6*d.*, but the four lowest were incomplete.

IT is stated that the architect for Cornwall county offices has visited Truro, and so modified the plans as to enable the council chamber to be built over the first floor offices, thus doing away with expensive excavations and reducing the original estimate by a considerable amount. It is probable the building will commence before the end of the year.

AT the last meeting of the Sutton-in-Ashfield Urban Council details of erecting a new gasholder were discussed, and it was said that the Council had to choose between a holder with a capacity of 300,000 cubic feet or one with double this capacity. The estimated cost of the larger holder was 8,500*l.*, and of the smaller one 6,000*l.* It was decided to obtain tenders for the erection of holders of 400,000 and 600,000 cubic feet capacity, in order to compare the prices.

MR. F. H. TULLOCH, a Local Government Board inspector, has held an inquiry at Jarrow respecting the application of the Town Council for sanction to borrow 6,000*l.* for the provision of a swimming bath and slipper baths with offices on the site of four dwelling-houses in Walter Street. The cost of the site was 1,185*l.*, and the architects' estimate for the erection of the building 3,575*l.* The total cost would be 6,000*l.* There was no opposition.

SIR GEORGE H. CHUBB is to be presented with the freedom of the borough of Wolverhampton in recognition of his services to the State and town on October 14, when he will visit the town accompanied by the Lord Mayor of London. The world-famous firm of Messrs. Chubb was first established by Sir George's grandfather in St. James's Square, Wolverhampton, ninety years ago, and has ever since been steadily increasing the size of their factories.

MR. B. T. BATSFORD'S autumn announcements include "Windows: a Book about Stained and Painted Glass," by Lewis F. Day (third edition); "Nature and Ornament," by Lewis F. Day, Part II., dealing with Ornament, the finished product of Nature; "English Furniture and Decoration from 1680-1800," by G. M. Ellwood; "The Growth of the English House: a Short History of its Architectural Development from 1100-1800," by J. Alfred Gotch, F.S.A., F.R.I.B.A.; "English Leadwork: its Art and History," by Lawrence Weaver, F.S.A.; "Modern Cabinet Work, Furniture and Fitments," by Percy A. Wells and J. Hooper.

A SUM of 30,000*l.* has been subscribed for the erection of a new infirmary at Bradford. A site has not yet been acquired, but Sir Francis Sharp Powell, M.P., has been approached, in the hope that he will be willing to dispose of some fifteen acres of land on his estate at Horton. Sir Francis has promised to give consideration to the matter at the end of the present Parliamentary session.

AT the last meeting of the Worksop Guardians Mr. F. Hopkinson, architect, Worksop, presented an amended plan of a proposed consumptive sanatorium at Kilton Hill Infirmary, showing the back and end walls to be of brick instead of wood as at first proposed. The plan was adopted, and it was decided to apply to the Local Government Board to sanction a loan of 925*l.* for thirty years to carry out the work.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

BY SPECIAL APPOINTMENT TO HIS MAJESTY.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the SCAGLIOLA can afterwards be fixed round WITHOUT SHOWING JOINT.

Prize Medals, 1851 & 1862.

A DECORATIVE MATERIAL of the RENAISSANCE WHICH HAS STOOD THE TEST OF CENTURIES.

COLUMNS, PILASTERS, WALL-LINING, DADOS, and all forms of INTERNAL DECORATION.

Descriptive Circular on Application.

THE Railway Passengers' Assurance Company, which was originally established in Old Broad Street in 1849, and has been housed at 64 Cornhill for the past half-century, has determined (in co-operation with the Union Bank of Scotland) to rebuild its premises, which will in future comprise 61, 62, 63 and 64 Cornhill, 124 and 126 Bishopsgate Street, and 1 White Lion Court. During the rebuilding, which will commence at once, the company's address will be 81 Cornhill, E.C.

AT Rochdale a committee has been appointed by the Town Council to consider the scarcity of working-class houses in the town, and to report as to the best means of getting dwellings built. It was stated that the number of houses built in the borough from 1890 to 1905 averaged 405, and since then it had fallen to 232, whereas to keep pace with the number falling into decay and the increase of population, at least 500 houses should be built in each year. The principal speaker laid particular stress on the poor quality of work that was put into workmen's houses.

THE Aberdeen Town Council on the 15th inst. adopted a recommendation by the water committee to the effect that the committee make application in the next session of Parliament for a Provisional Order under the Private Legislation Procedure (Scotland) Act to authorise them to take a supply of water for the city from the river Avon in accordance with the scheme outlined in the report submitted by Sir Alexander R. Binnie and Mr. G. F. Deacon, and remit to the committee to take such steps as might be requisite for the purpose. The capital cost of the scheme was estimated as follows:—First instalment of 10,000,000 gallons a day, 1,068,500*l.* (or at the rate of 106,850*l.* per million gallons per day); and for the second 10,000,000, 443,500*l.*; making a total of 1,512,000*l.*

THE Agent-General in London has just received the annual report of the Forestry Department in Queensland. The total forest area in the colony is 40,000,000 acres—the whole forest area of Australia is 97,003,000 acres. Special areas of timber amounting to close on 4,000,000 acres are reserved by the Government. The export of timber from Queensland for 1908 was 800,000 super feet; the greater part of this was undressed timber. Japan took about half of this quantity, and the United Kingdom and Germany came next as buyers. The saw-milling industry is active in Queensland; 65,000,000 feet of soft woods and 35,000,000 feet of hardwood were cut in 1908. The value at the mill per 100 super feet is:—Soft woods, 12*s.* 6*d.*; hardwood, 13*s.* 10*d.*; and cedar, 33*s.* 4*d.*

THE Sheffield Master Builders' Association have decided to give the prescribed notice for the abolition of walking-time. This will have the effect of bringing a much-debated point before a meeting of the Conciliation Board. According to the *Sheffield Daily Telegraph*, for some months now the builders and their men have been trying to readjust the question of walking-time. It is contended by the masters that outside contractors, in carrying out work outside the city, have an unfair advantage, inasmuch as they can draw on local labour without paying lodging money or transit fares, whereas these have to be paid by the Sheffield builders. The masters want the arrangement not to apply to men "started on the job," but the operatives object. Hence the deadlock. It is hoped the Conciliation Board will find a solution.

AT the last meeting of the buildings committee of the First or Upper District Committee of the County of Renfrew, it was intimated that plans had been lodged for the erecting of the following buildings:—Villa at Kirkhill, Mansewood, for Thomas Hendry, 33 Renfield Street, Glasgow; nine tenements in Yoker Road, Yoker, for William Anderson, junior, 49 Bellfield Street, Glasgow; double villa in Nevis Road, Hillpark, for John Taylor, Victoria Street, Larkhall; cottage at Old Hall, Paisley, for David Brown, junior, 15 Greenlaw Avenue, Paisley; two tenements at the corner of Garry Street and Spean Street, Cathcart, for Richard Henderson, 116 Hope Street, Glasgow; double cottage in Hillhead Road, Crookston, for John Young, Lennox Road, Crookston; double cottage in Busby Road, Clarkston, for James Lindsay, Whinfield, Brisbane Road, Largs; infant school and laundry block at Yoker Public School, for the Renfrew Landward School Board; alterations on farmhouse at Waterside Farm, Mearns, for J. C. Fergusson Pollok; double cottage in Holehouse Brae, Neilston, for Mrs. J. Quinn, Neilston; ten double cottages in Paisley Road, Barrhead, for Messrs. Young & Pollok, Main Street, Neilston. The valuation of the various proposals was estimated at 40,720*l.*, as compared with 30,510*l.* for the corresponding period of last year.

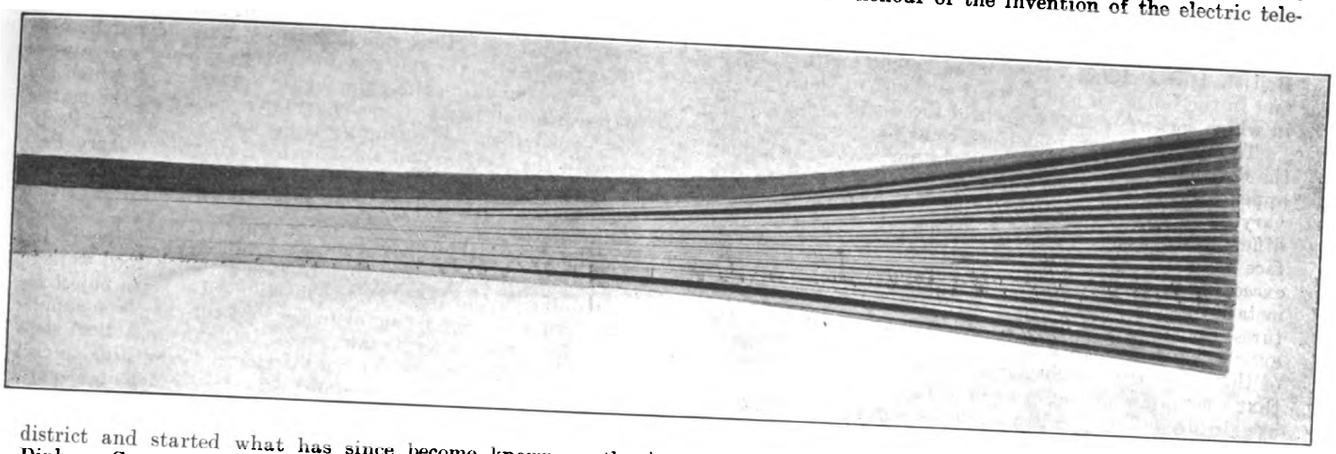
NEWMAN'S PATENT REGULATING HELICAL SPRING HINGES.

WITH PATENT STOP TO PREVENT OVERWINDING.
The power can be instantly taken off while the Hinges are being fixed and afterwards adjusted to close the door conveniently. They cannot be overwound.
Made in Brass and Iron, 3, 3½, 4, 4½, 5, 6, and 7 inches.

NEWMAN'S NORTON SYSTEM.
MADE IN MALLEABLE IRON.
The Best Door Spring and Check for closing doors without noise.
Pressure is direct, but diminishes pleasantly as door is opened.
Also made with Patent Regulator to latch stubborn bolts.



NEWMAN'S PATENT INVINCIBLE,
WITH AND WITHOUT PNEUMATIC CHECK.
Will hold door *rigidly to centre*, but diminishes in power as door is opened, allowing comfortable passage through.
The *Best* Spring to close door *against wind pressure*, and the most suitable for Banks, Schools, and other public buildings. Made in sizes to suit all doors.

Made solely by W. NEWMAN & SONS,
DOOR SPRING MAKERS AND BRASSFOUNDERS,
Established over 100 Years. HOSPITAL ST., BIRMINGHAM.

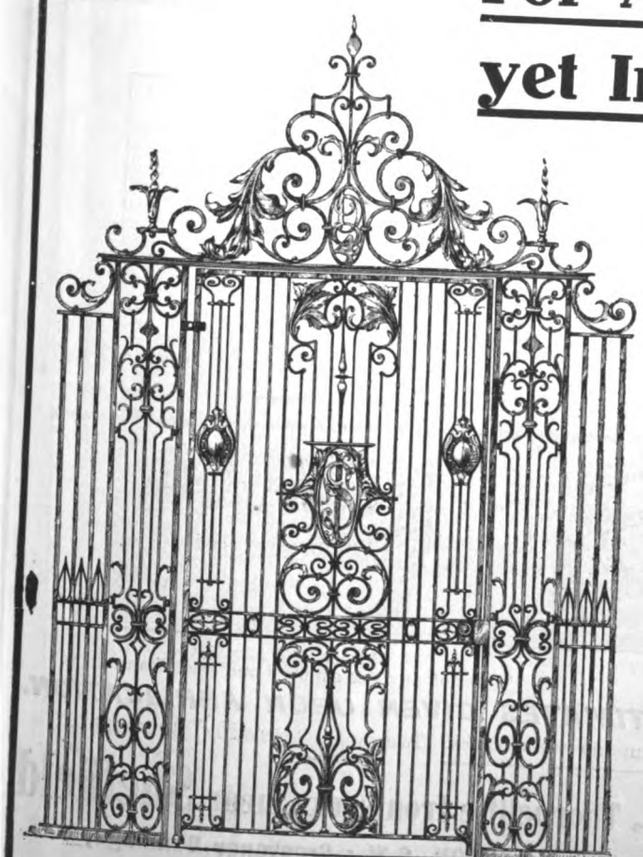
FESTINIOG ("PORTMADOC") SLATES.

IT is now over two hundred years since slates were first known to be extracted from the outcrop of the slate veins in the mountain sides round about Festiniog. These were used on the roofs of farmhouses and buildings in the neighbourhood, which are in existence at the present day unimpaired by the ravages of time, and testify to the exceedingly durable nature of Festiniog slate as a roof covering. It is not, however, until the year 1765 that we have any record of regular quarrying operations being undertaken. In that year two quarrymen came to Festiniog from the Carnarvon



district and started what has since become known as the Diphwys Casson Quarry. This was subsequently sold in the year 1800 to two Englishmen, from one of whom, named Casson, the quarry obtained its name, and from that year on capital came to be attracted to the district. During the subsequent half-century most of the now famous quarries were opened. "In 1825," says Mr. Owen Morris in a pamphlet entitled "Portmadoc and its Resources" (1856), "there was a mania for working slate quarries in Wales. Many companies for that purpose were formed in London. One of them, styled the Welsh Slate Company, of which Lord Palmerston and Lord William Powlett are partners, purchased from Mr. Holland a portion of the ground on which were the quarries he had opened, and pursued the workings there with great vigour."

This quarry, together with that opened by Mr. Holland and a neighbouring one worked by a Mr. Matthews, now form the main portion of the workings of the Oakeley Quarries, which are the largest in the district.

Besides Lord Palmerston's, another eminent name closely associated with slate quarrying enterprise in Festiniog is that of Sir William Fothergill Cooke, who shares with Wheatstone the honour of the invention of the electric telegraph. He having come to live in the neighbourhood became much interested in the slate quarries, and was chiefly instrumental in starting the Maen Offeren Quarry, which was launched as a limited company in 1864. Another name very prominent in the development of the industry at this period is that of John W. Greaves. He gave his business, as a quarry owner, the close and constant attention of an able mind, and was responsible for much in the way of improvement, both in the method of extracting the slate and preparing it for market. Mr. Greaves exhibited slates from his quarry at the Great Exhibition of 1851 and was awarded

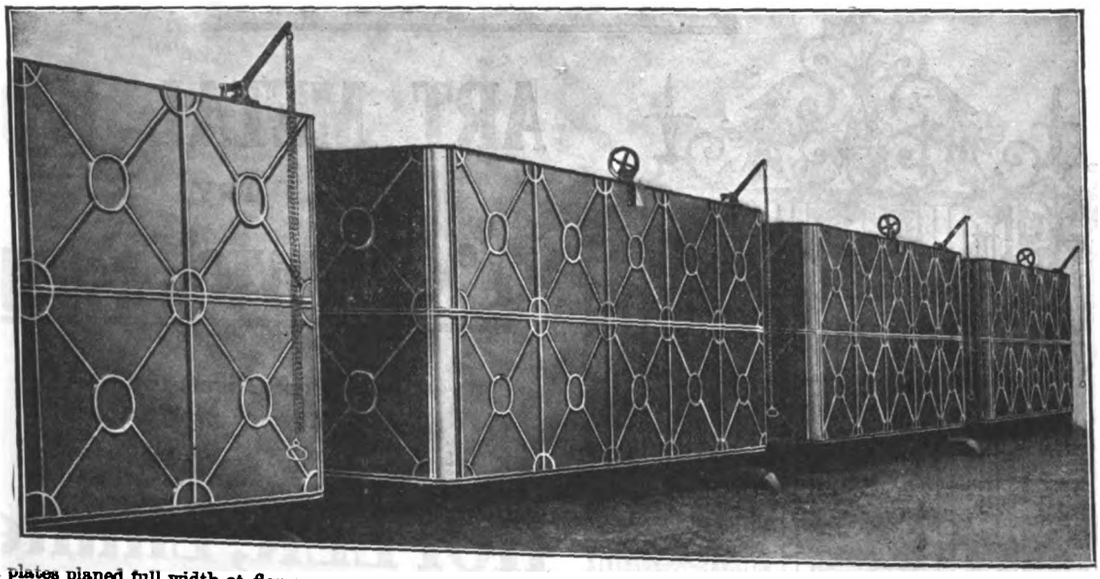
a prize medal. His firm also won prize medals with their slates in London in 1862 and in Paris in 1867. At the Paris Exhibition of 1889 both the Oakeley Slate Quarries Company and the Votty and Bowydd Slate Quarries Company were awarded prize medals for their exhibits of Festiniog slates.

During the second half of the nineteenth century the Festiniog slate industry developed to large dimensions, as the superior quality of the slates there produced became known and appreciated. In 1850 the output of the quarries was 44,874 tons, and this in 1873 had grown to 144,880 tons of manufactured slates, and, with fluctuations, has remained between 100,000 and 150,000 tons since that date.

This large output finds a market not only throughout the British Isles, but also to a large extent on the Continent and in the Colonies, and is itself evidence of the high esteem in which Festiniog slates are held the world over.

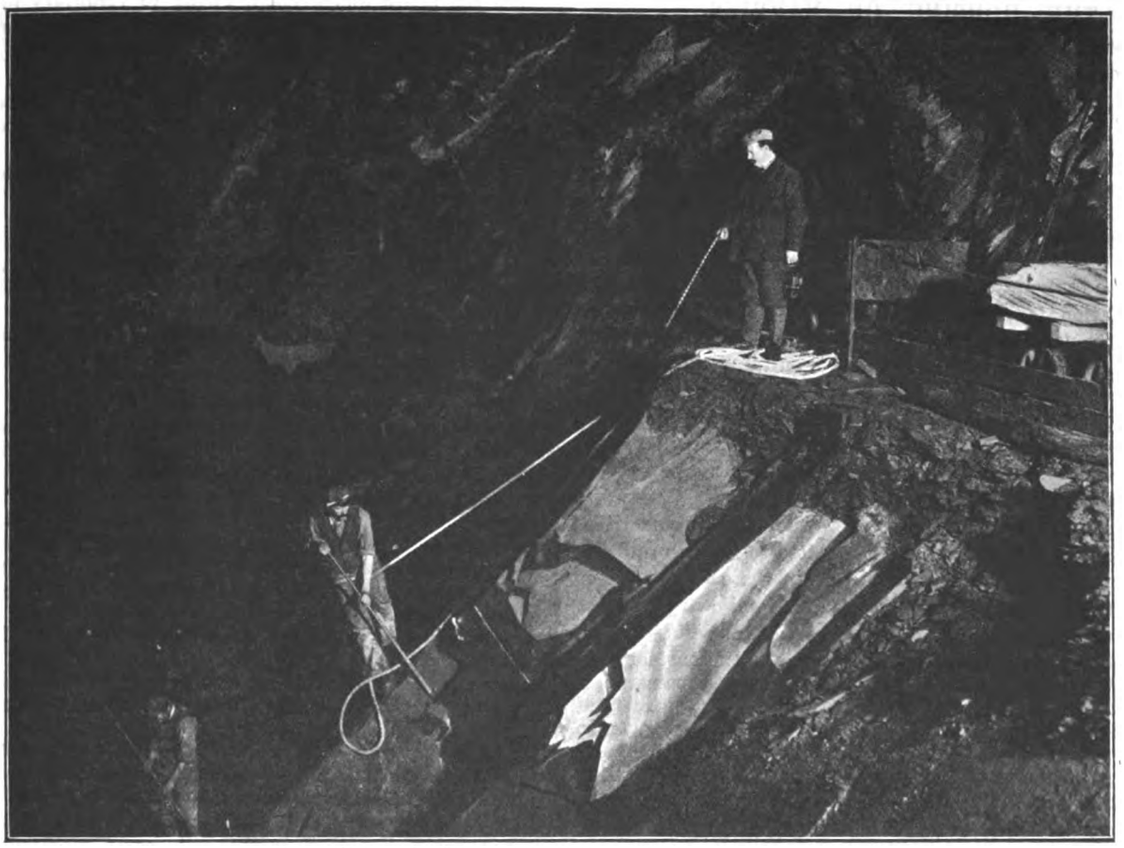
Though at least five distinct veins or beds are worked in the district, the slates produced do not vary very widely in appearance or texture. They are all of a blue-gray colour, varying slightly, but to the casual observer showing but little difference between one vein and another. The cleavage surface is generally remarkably smooth and fine. They are exceedingly strong, and when rapped have an almost metallic ring. Each vein has, however, its distinctive features, and with these it is proposed to deal in a subsequent article which will go more minutely into the characteristics of the slates from each vein in turn. Suffice it to say now that the slate veins at present being worked in the district are, in descending geological order, known as "The North Vein," "The Back Vein," "The Old Vein," "The New Vein," and the "Craig Ddu" and "Wrysgan" veins. The two latter may or may not be identical.



One of the most marked features of the Festiniog rock is its pliability. Long strips split thin can be bent like a well-tempered blade (*vide* illustration), and this feature has been shown in the case of actual roofing slate by the following experiment:—A 24-inch by 12-inch slate was placed on supports 22 inches apart and a weight gradually applied in the centre. Before breaking point was reached the slate showed a deflection of 0.28 inch in one case and 0.35 inch in another case. The thickness of the slate was measured as 0.19 inch in the first instance, and 0.17 inch in the second instance. This is undoubtedly a feature of value in a roofing slate, as it prevents the slate cracking under any slight movements of a roof, such as those caused by wind pressure, subsidence, or slight earthquake shocks such as are frequently experienced in this country.

Festiniog slates are very generally known in the trade as "Portmadocs," after the name of the port in Cardigan Bay at which they are put on board ship. Though the only genuine "Portmadoc" slates come from this district, the term has been known to have been given a very wide application in the hands of unscrupulous dealers, and has been used by such persons to describe not only slates of inferior quality from other districts in North Wales, but also slates of foreign origin. Architects and builders should therefore exercise every care to see that the slates they pass or purchase as "Portmadocs" are the genuine article. They can always do so by demanding the name of the quarry from which the slates originate, and if they have any doubts on the matter can dispel them by communicating with the quarry itself, or with the secretary of the Festiniog District Quarry Proprietors' Association, who is always ready to render any assistance within his power in dealin gwith matters of this nature.

The Association just mentioned came into being in the year 1894, and has since that time done much good work in consolidating the trade of the district. Its main object for some years was the fixing of prices, but this has been supplemented, particularly of late years, by many practical steps for promoting the trade of the district and obtaining specific recognition for Festiniog slates from Government Departments and public authorities.



With the exception of a comparatively few quarries, those now at work in the district are members of the Association, and after what has been said it may not be out of place to give a list of them. Roughly in order of their respective outputs the quarries composing the Festiniog District Quarry Proprietors' Association are the Oakeley Slate Quarries Company, Ltd., Messrs. J. W. Greaves & Sons, Ltd., the Votty and Bowydd Slate Quarries Company, Ltd., the Maenofferen Slate Quarry Company, Ltd., the Craig Ddu Slate Quarry Company, Ltd., the Bwlch-y-Slater Slate Quarry Company, Ltd., the New Rhosydd Slate Quarry Company, Ltd., the Diphwys Casson Slate Quarries Company,

QUARRYING SLATE ROCK, UNDERGROUND CHAMBER.

Ltd., the Park and Croesor Slate Quarries Company, Ltd., the Glanrafon Slate Quarry Company, Ltd., the Wrysgan Slate Quarry Company, Ltd.

Festiniog is unique as a slate-quarrying district in this country in that the majority of the quarries there are worked on the underground principle, and are, in fact, mines, in contrast to the open pits more usually seen elsewhere. As mines they are distinctly remarkable, the vast chambers opened in quarrying the slate constituting some of the largest to be seen underground throughout the world. Our illustration gives a view of men quarrying slate in one of these chambers some hundreds of feet from the surface.

THE HOUSING OF NAVVIES.

THE Local Government Board have issued a highly interesting report prepared by Dr. Reginald Farrar, on the subject of "lodging workmen employed in the construction of public works." Of this we give the following abstract:—

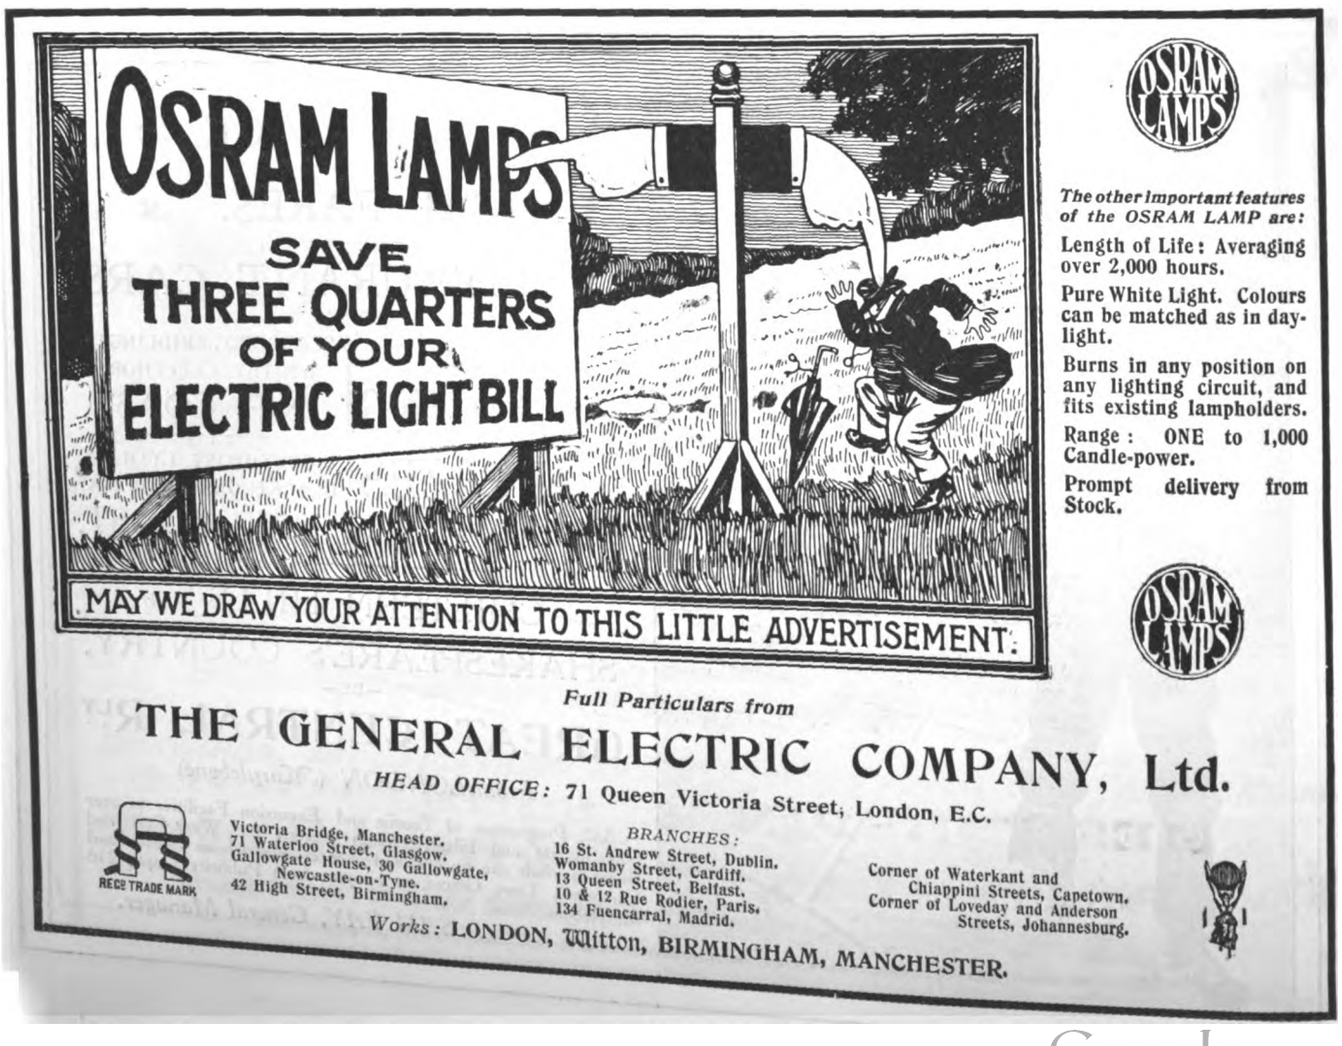
Navvies move about from one public work to another, a distinct class or tribe, separated by habit and circumstances from the rest of the community. It is estimated that navvies and their families form a community numbering about 100,000.

In the early days of railway construction the housing accommodation for those men was very poor and scanty, or frequently none at all; many slept in sod huts, which they constructed for themselves, or in farm buildings, or wherever they could; wages, about half-a-crown a day, were paid at fortnightly, or in some cases monthly intervals, and most contractors kept provision stores and paid the men partly in food tickets, sometimes even forcing them to take a percentage of their pay in beer.

The evils that arose were so grave that a select committee of the House of Commons was appointed to inquire into the condition of the labourers employed in the construction of railways and other public works. The following extract from their report, published in 1846, is of interest:—

"As regards the class of labourers under consideration your committee cannot but conclude that the circumstances under which their labour is carried on are too generally of a deteriorating kind. They are brought hastily together in large bodies; they are therefore crowded into unwholesome dwellings, while scarcely any provision is made for their comfort or decency of living; they are released from the useful influences of domestic ties, and the habits of their former routine of life (influences and habits the more important, in proportion to their want of education); they are hard worked; they are exposed to great risk of life and limb; they are too often hardly treated; and many inducements are presented to them to be thoughtless, thriftless and improvident."

The condition of navvies has, on the whole, improved since the above was written, owing to voluntary provision made by contractors and employers. To this the improved general standard of comfort, the growth of philanthropy, the pressure of public opinion, and the special influence of such bodies as the Navvy Mission Society have contributed; but to some extent the quotation is still applicable to existing conditions.



Their Report contained, among other recommendations, the following:—

"Your committee is of opinion that, previous to the collection of a body of these work-people at any spot, a sufficient lodging for them should be ascertained to exist. When the neighbourhood cannot adequately supply it, then the company should be required to provide it. Comfortable arrangements for lodging the men are directly and indirectly amply remunerative for the additional expense they may at first entail."

Except in so far as they are covered by the Truck Act and Employers' Liability Act, no legislative effect has been given to these recommendations. The Board of Trade have no jurisdiction over navvies, and no control over railways until a line is ready for inspection prior to being declared open for traffic.

Although, however, the accommodation provided has been, on the whole, improved, and although the standard of comfort among the best men is higher, the difficulty of providing adequate accommodation is serious by reason of the presence of a large number of men on public works of inferior moral and physical development, casual and irregular workers, for all of whom it is not possible to provide lodging, and who are often unwilling to avail themselves of such provision if made.

It is often stated by men of wide experience that the old navvy is tending to die out, and is being replaced by morally and physically weaker men. This is said to be due, in part, to the replacement of human labour by machinery, and particularly by the "steam-navvy," which may be roughly computed to employ 20 men while performing the work of 50. Each steam-navvy used has, therefore, displaced about 30 men, and the use of machinery in general has in a measure superseded the need for special strength and skill, which were formerly characteristic of navvies.

Digitized by Google

Periods of trade-depression also tend to draft on to public works of construction men displaced from other employments, many of whom are social failures, having neither the will nor the physical strength requisite for continuous work.

In this connection it may be noted that a deputation from the Navvy Mission recently waited on the President of the Local Government Board to protest against the employment of local unemployed on works of construction in certain districts, to the exclusion of regular navvies. Evidence was given to the effect that pressure is being brought to bear upon contractors practically to discharge navvies and take on the local unemployed. It was claimed not only that this policy is wasteful and economically unsound, because numbers of this latter class are unfit to perform navvy labour, while others are too lazy to work, but also that it constituted a real hardship to genuine navvies, many of whom are thereby kept out of employment at a time when work is generally scarce and there is exceptional depression in respect of works of construction.

Wages.—Ordinary labourers on works of construction are generally paid 5½*d.* or 6*d.* an hour and may make on an average 3*s.* 6*d.* a day. In some cases men were only paid 4½*d.* an hour. It is generally considered by the men that the standard wage should not be less than 6*d.* an hour. The work is subject to great fluctuations on account of weather conditions. One degree of frost stops concreting, and a hard shower of rain stops puddling for the day. Specially strong or skilled men, such as those engaged in tunnelling, may make 7*s.* or 8*s.* a day.

The carrying out of public constructive works entails, as a rule, the temporary immigration into the district of a more or less numerous body of strangers, men, with some women and children. In the case of works carried out in a limited area in the immediate vicinity of a large town, the workmen may be recruited from, or may find accommodation among, the normal population.

Great numbers of navvies in large towns in or near which public works are in progress resort to common lodging houses.

In some cases, particularly if the works in progress are likely to lead to permanent increase of population and employment in the district, it may pay the contractors to build new houses or to lease existing houses for the accommodation of their workpeople. Thus, the contractors for the King's Dock, which is now being constructed for the Swansea Harbour Improvement Trust, have built fifty-one houses and rented other sixty houses for this purpose.

Even in rural districts, if there are any villages within reasonable distance of their work, a certain proportion of the workmen will find private lodgings. Decent single workmen can usually do so, but self-respecting cottagers generally refuse lodgings to men who have become degraded by "sleeping rough," such men being usually dirty, and possibly verminous. Nor can women and children, dependents of navvies, easily obtain lodgings if strangers to the district.

The letting of private lodgings to navvies often leads to overcrowding in houses.

Lines of temporary or permanent rails, necessary for the transport of material, are sometimes utilised to convey men to or from their lodgings, whether these be private lodgings or temporary huts provided by the contractors. On such works accommodation of a less substantial type than may be required for more permanent work may be sanctioned, *e.g.*, tents, or light wooden or papier maché huts.

For lack of accommodation within convenient distance, many navvies walk long distances to and from their lodgings. In several cases men have walked five or six miles each way. Those who ride bicycles can solve the problem of lodgings with greater ease.

Some works, particularly reservoirs, are situated in remote and mountainous localities. In such cases temporary accommodation in huts must be provided, or the work-people will be altogether homeless.

Many contractors erect huts, which are generally temporary buildings of corrugated iron or wood. A common type is a hut let to a foreman, who takes in lodgers. He and his family occupy, say, two rooms at one end; at the opposite end is a dormitory for lodgers, and between the two a common kitchen and living room. The average number of lodgers in these huts is from fourteen to twenty. The men pay 12*s.* to 14*s.* weekly for board and lodging.

In point of cubic air space and general accommodation, these huts appear to be usually satisfactory. They are readily erected and taken down and can be carried from one public work to another; their initial cost is not great, and

they probably pay the contractor in the long run. This system, subject to proper inspection, may be recommended.*

Recreation Rooms.—The provision of recreation rooms serving the purpose of clubs should be regarded as a necessity of navvy life. In the absence of such provision the public house is practically the only place of resort available. In some instances they are provided by contractors; in some they are provided and managed by benevolent private persons.

Many contractors, but not all, provide mission-rooms in which religious services can be held.

Shelters for Meals.—It is desirable that on all works shelters should be erected in which meals can be taken. These shelters should contain stoves on which tins of coffee, &c., can be heated. Such shelters are also of service as affording a refuge during showers of rain.

The temperance question as affecting navvy life cannot be fully discussed in this report; neither can it be wholly ignored, for it is a matter of common experience that want of proper accommodation conduces to drunken habits among this class, and, conversely, that drunken habits, as leading to intermittent and irregular work, aggravate the difficulty of providing the necessary accommodation. Navvies who are strictly temperate seldom fail of securing regular work and good lodging.

Some managers of public works have found it useful to have the control of the liquor traffic on their works in their own hands.

In the absence of special clauses in local Acts compelling the provision of housing accommodation, it is left wholly to the discretion of individual contractors what accommodation, if any, they shall provide. In some instances no housing provision whatever is made, and the workmen are left to find lodgings as best they can; in others the arrangements are excellent; while other works of construction exemplify various degrees of difference, both as to the character and the amount of accommodation provided, between these extremes.

There are many works on which scores and even hundreds of genuine navvies are "sleeping rough" night after night. On some works they have no better provision than sod huts. Life under such conditions is conducive to physical ill-health and moral deterioration.

A contractor who provides proper and adequate lodging for his workmen is in most cases able to attract to, and retain on, his works a sufficient number of competent men. The services of strong, steady, and respectable navvies are greatly in demand: such men are usually able to choose their own job.

It is obvious that when a large proportion of the men are casual and intermittent workers, a larger number of men must be retained in the neighbourhood than are employed at any one time: to keep 500 men constantly at work a contractor often needs to have at least 750 names on his pay-sheets, and thus increases the consequent strain on the accommodation.

A contractor who carries out public works of construction and who imports into the district a large number of labourers may properly be held to be morally responsible for providing accommodation for his workpeople, and should be under obligation to do so. It is also to be desired that he should be required to provide such conditions of life as shall attract a definite number of regular workmen rather than an indefinite number of casual and intermittent workers.

There is often a marked difference between the provision made by municipal corporations or corporate bodies, such as the Derwent Valley Water Board, and that made by private contractors. In works undertaken by the former there is no question of private profit, and therefore no temptation to save money at the expense of the comfort of the labourers. On the other hand, works let out to private contractors are usually allotted to the lowest tender, and, owing to stress of competition the margin of profit is "cut" so fine that they are under a strong inducement to save money by neglecting, unless compelled to do so, to provide lodgings for their workmen.

(To be continued.)

* Private huts, *i.e.*, not provided by contractors, but erected by private persons as a business speculation, of similar construction and accommodating a like number of workpeople, are often erected in the vicinity of public works. These offer good accommodation, but are open to the objection that "shebeening" (the illicit sale of intoxicating liquor) is almost always carried on in them. "Shebeening" often goes on in the contractors' own huts, but can be to some extent controlled in them, but this is extremely difficult to do in private huts. It is to be desired that contractors should provide and retain control over all huts, but if private huts are allowed to be erected, they should be kept under close inspection.

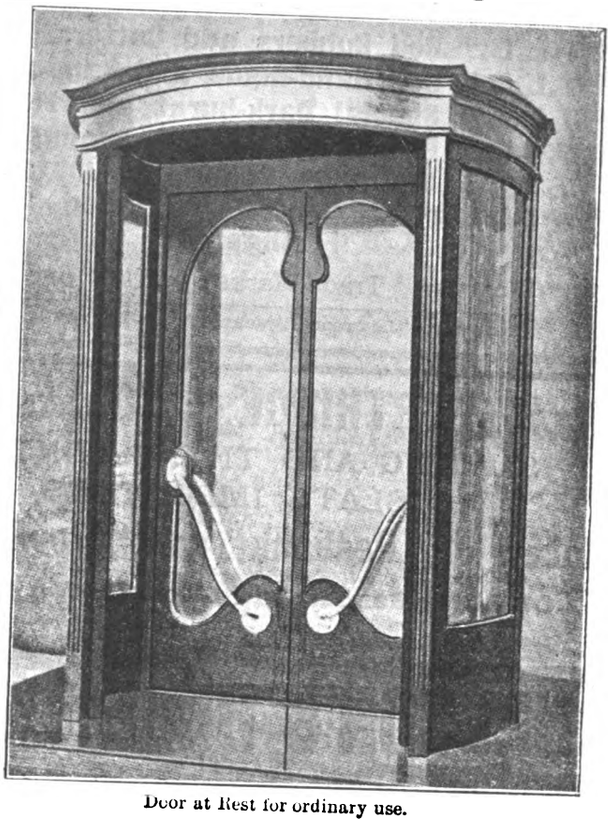
STRAND PALACE HOTEL.

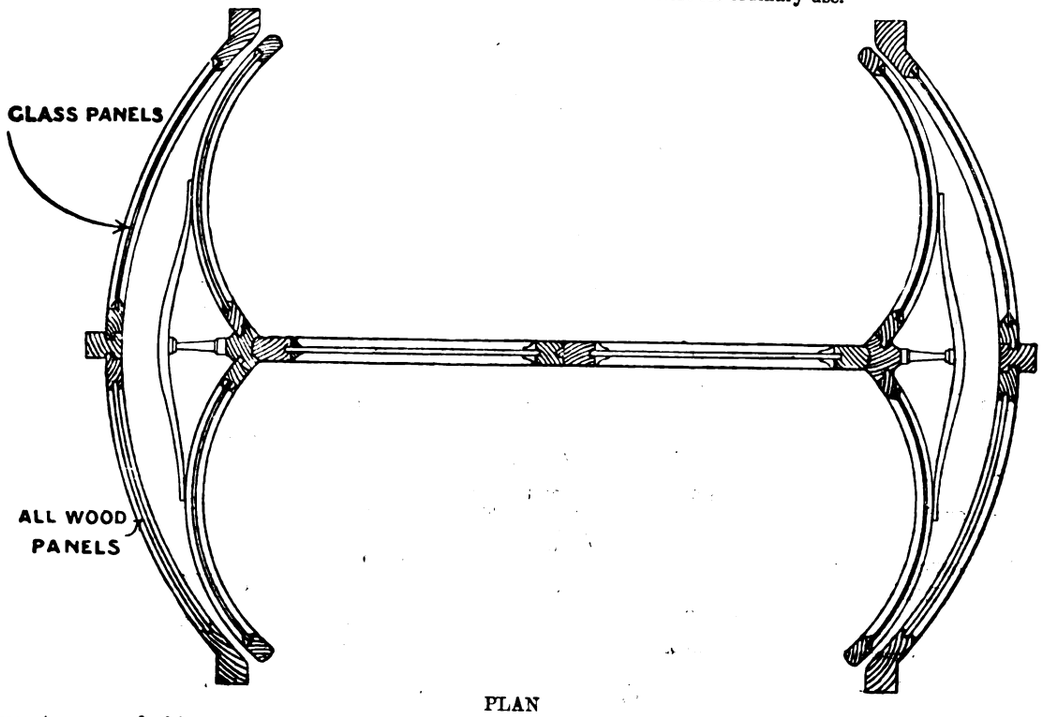


SAMUEL ELLIOTT'S PATENT ANTI-CYCLONE (Two-Way) DOOR

(Manufactured by SAMUEL ELLIOTT & SONS, Ltd., Caversham, Reading)

has been fitted at the above Hotel. This is the first Two-Way Door fitted in the United Kingdom.

Centre Doors opening for Emergency Exit.



Door at Rest for ordinary use.

Advantages. — Either section gives twice the amount of space available in any existing revolving door, all fear of the next division behind interfering with forward progress is eliminated.

Appearance. — It has a much better appearance and is architecturally infinitely superior to any of the revolving four way doors on the market.

Position of Wings. — By the mechanical apparatus these always return to the sides, preventing the uneven appearance of the wings of other revolving doors.

Fire Exit. — The greatest advantage in the Gilmour Anti-Cyclone Door is situate in the fact that all other revolving doors require lever manipulation to dislocate the leaves in order that a rush of people can pass, and most of them leave the wings in the centre of the opening. With the Anti-Cyclone Door an entirely different method is adopted. The wings always resting at the side against the circular framing, the centre between the two wings is composed of a pair of doors which when pushed open outwards **leave absolutely free egress to a crowd**, this centre pair of doors being in effect a pair of **exit** doors entirely in accordance with the requirements of the London County Council for fire exit doors in theatres, music halls, &c.

PLAN

It is now generally known that the Prefect of Police in Paris recently condemned certain styles of revolving doors owing to several fatal accidents having occurred through the time taken in, and lack of knowledge of, releasing the said doors. This Anti-Cyclone Door, on the other hand, is permitted by the Paris Prefect of Police, and is being hung generally in that city, among the numerous buildings that have adopted it being: Maxim's, Rue Royale; Palace of the Quai d'Orsay; Universal Brewery, Avenue de l'Opéra; Clillon Hotel, Place de la Concorde (two doors); Louvre Hotel, Place de Théâtre Français; Bernot Frères & Co., Rue Lafayette; Crédit Lyonnais, the Largest Bank in France; Moulin Rouge, Place Clichy, and at 27 Boulevard Diderot. They are also fixed in many places at Nice.

Llewellyn Williams's Patent
Chimney Pot & Ventilator

Regd. No. 24315.

No Tubes. No Noise. No Friction. Swept like an ordinary chimney.

THIS POT acts under all conditions of wind and situations, is made in two parts, creating up draught without friction, and making down draught impossible. It can be swept or cleaned like an ordinary chimney pot and taken apart when required.

Advantages claimed: Certain Cure for Smoky Chimneys. No working parts to get out of order. No tubes to calcine. Always free from condensed water, the flue being disconnected from outer pot is kept dry. Swept like an ordinary chimney, straight through. No dust can accumulate

Ventilators made in strong Sheet Iron, Zinc, or Copper.

The Value of a House

depends on its arrangements for comfort and convenience. Houses that are supplied with modern conveniences rent better and sell better.

Supplied with a Vacuum-Cleaning Plant

the house has an additional attraction in the eyes of the tenant—he at once sees its advantages as a promoter of health, a saver of labour and expense, and a great convenience at all times.

For a total Charge from 50 guineas

we will install a complete vacuum-cleaning plant with all necessary fittings for each floor.
These plants can be supplied with either petrol or electric motors, or connected with any power on the premises.

The Value of Vacuum Cleaning

is universally acknowledged, and the question of expense is solved by the price quoted for a complete installation. The price represents but a small fraction of the cost of the building, and is a permanent investment of greatest value.

The British Vaouum Cleaner

thoroughly removes all dust, dirt, and moth from Carpets, Tapestry, Upholstery, Walls and Mouldings, without the slightest injury to the most delicate fabrics, and without disturbance to the household.

This is Your Guarantee.

We are the only Company possessing testimonials of ten years' satisfactory working, and are now recognised as the leading and most reliable and successful firm engaged in Vacuum Cleaning—in fact, we are the original inventors of this world-famed Vacuum-Cleaning process.

The British Vaouum Cleaner

(Booth's Patent) is the GREATEST invention of modern times.
Through our licensees throughout the Continent, this, the best system of house cleaning, has been almost universally adopted.
This is an instance where a British invention has found eager purchasers to a far greater extent in foreign countries than at home.

ARCHITECTS are requested to write for full descriptive booklets.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

A special meeting of the Melbourne Parish Council was held last week to consider a letter from Mr. Jardine, asking for the support of the Council for a Provisional Order for electric lighting which was proposed to be applied for. The letter further stated that it was proposed to spend on the Kendrick Mills a sum of from 7,000*l.* to 10,000*l.* in building a factory in which to introduce a new industry in Melbourne, in improving the electric light plant and mains, and in putting down storage batteries, &c. The Council decided to inquire as to the charges it was proposed to adopt under the Provisional Order before coming to a decision as to whether the order should be supported or opposed.

Surveyor's estimate	695	0	0

TRADE NOTES.

We have to congratulate our contemporary the *Iron and Steel Trades' Journal*, on attaining its diamond jubilee. The number issued on Saturday last, September 25, marks the commencement of their sixty-first year.

Mackay's patent direct-acting ventilators have been supplied for the ventilation of the new schools at Blaydon-on-Tyne, erected from the plans of Mr. J. Morson, architect, Newcastle-on-Tyne.

The new clock and chimes presented to the Bardsey parish church, North Wetherby, have been set in motion. They have been made and fixed by Messrs. Wm. Potts & Sons, Ltd., clock manufacturers, Leeds and Newcastle-on-Tyne. Messrs. Potts are making new clocks for York, Bridlington, Middlesbrough, Cumberland, and other places.

The three following schools are being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, of Manchester:—The Victoria schools, Ebbw Vale; St. John's schools, King's Lynn, and the Halton schools, near Aylesbury. Messrs. E. H. Shorland & Brother also inform us that the extensions to Napier Hospital, New Zealand, are again being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and special inlet ventilators.

Messrs. Arthur L. Gibson & Co. announce the completion of their new Radnor Works, Strawberry Vale, Twickenham. Henceforward all orders for Kinnear patent steel rolling shutters will be filled from that address. Owing to the rapid development of their business, and for the purposes of concentration, the company have found it necessary to remove their offices and warehouses to Twickenham to which all communications must now be sent.

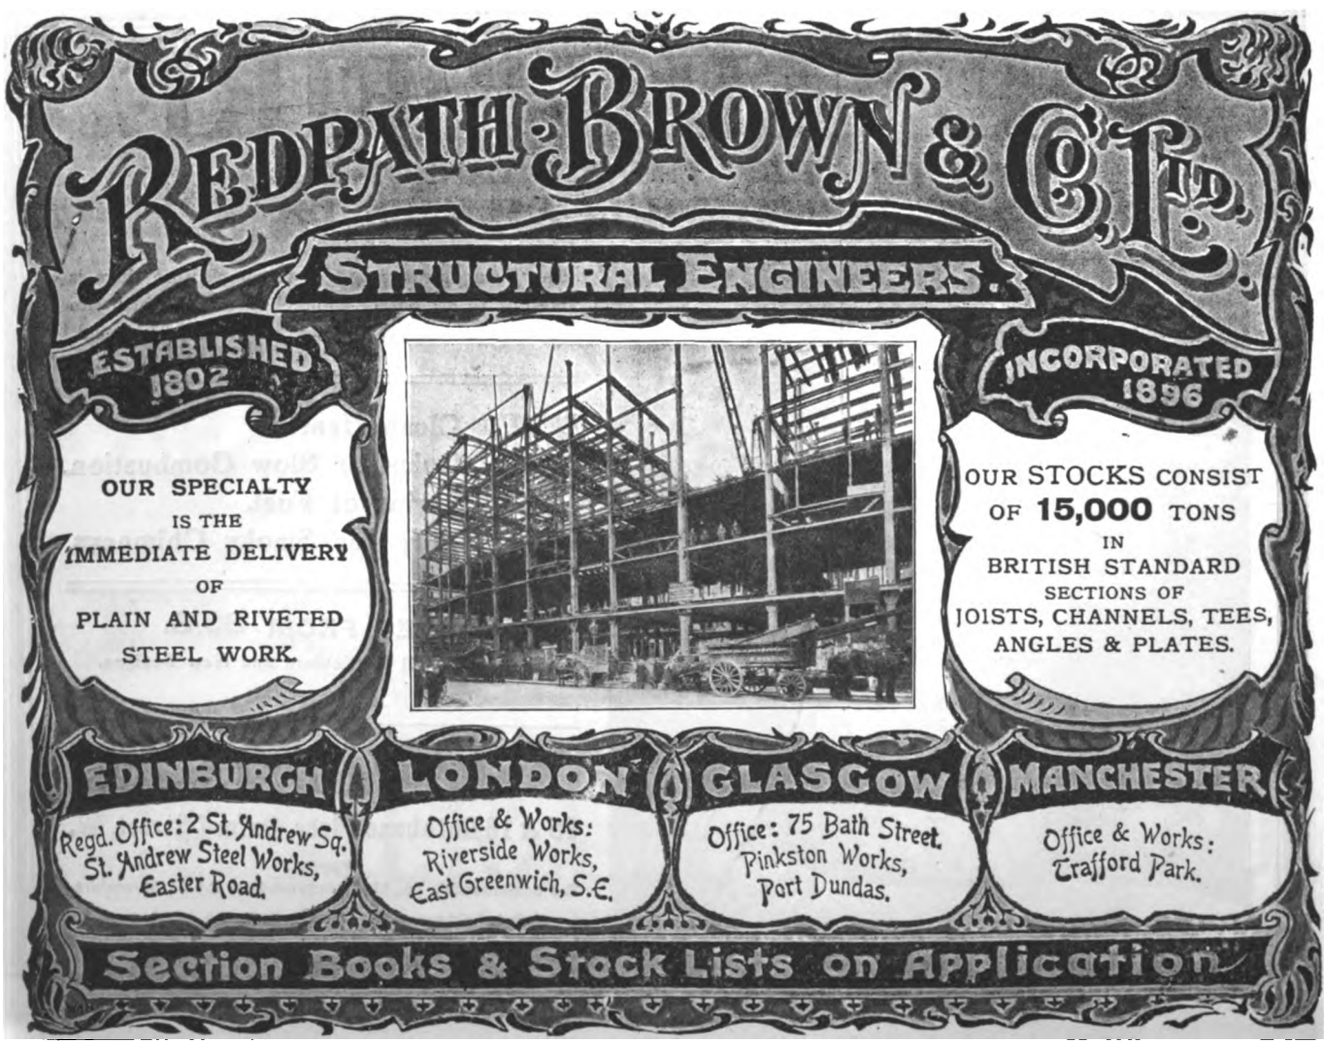
BUILDING AND BUILDERS.

The Staffordshire education committee have decided to ask the County Council to provide a sum of 1,050*l.* for the erection and completion of a new Council school at Hamstall Ridware.

At Ayr Dean of Guild Court last Friday plans were passed for the erection of five dwelling-houses in Monument Road, Ayr, by Messrs. J. & D. Meikle, builders, at a cost of 5,000*l.*

At Horsham last week the following plans were approved:—W. F. Pannett, four pairs of houses in Clarence Road; and H. Potter, coach-house and stables at "Eastdene," Bedford Road, for Mr. J. Burton.

The Mersey Docks and Harbour Board are considering a scheme for the erection of a destructor in Lightbody Street at a cost of 7,700*l.* It is calculated that it will mean a reduction of 1,000*l.* a year in expenses.



The Egham Rural District Council have approved of plans prepared by Mr. V. Gray, architect, for one section of the proposed hospital with administrative block and laundry. The outlay will be 1,800*l.*

The committee of the Dunfermline and West Fife Infectious Diseases Hospital are to consult Mr. Simpson, architect, Stirling, in regard to the proposed extension of the hospital accommodation.

The Chapel-en-le-Frith Guardians have adopted the scheme of Messrs. Moorwood, Sons & Co., of Sheffield, for alterations to the heating and cooking arrangements at the workhouse. It was decided to ask for permission to borrow 550*l.* to carry out the work.

The Southend Corporation have decided to apply to the Local Government Board for sanction to borrow 13,715*l.*, the estimated cost of erecting two electricity sub-stations for the purpose of supplying current in the eastern and western parts of the borough.

Messrs. White & Stephenson, architects, of Newcastle, have been instructed by a syndicate to prepare plans for an up-to-date skating rink and picture hall on a piece of land acquired from the Milburn estate, adjoining Hirst Schools, Ashington.

SECOND PREMIATED DESIGN FOR BERKSHIRE COUNTY COUNCIL OFFICES, READING.

ST. CHAD'S CHURCH, FAR HEADINGLEY, LEEDS.—NEW CHANCEL AND VESTRIES.

PARTICK Dean of Guild Court have granted lining for the erection of a new model lodging-house on a site in North Street and Jordan Street, Whiteinch. The building, which will accommodate 364 men, will be erected at a cost of 10,000*l*. The application was made by the Jordan Street House, Partick, Ltd.

AT the meeting last week of the Edinburgh Dean of Guild Court nineteen petitions were considered, and sixteen warrants were granted, including ten remits to the Burgh Engineer. Warrant was granted to Messrs. William Finlayson & Sons to erect two tenements at Piersfield, Piershill, and to the Lockhart Building Company to erect four houses on the west side of Craiglockhart Terrace.

THE Limerick Corporation recently made an application to the Local Government Board for a loan of 45,000*l*., under the provisions of the Housing of the Working Classes (Ireland) Act, and an inspector held an inquiry. It was proposed by the Corporation to erect 200 workmen's dwellings, and the necessary plans and details were submitted for approval. The Local Government Board have now consented to the erection of 100 workmen's dwellings on a revised scheme. It is uncertain if the Treasury will advance the money, in view of their refusal to grant, owing to the high city rating of 11*s*. 6*d*. in the £, a loan of 10,000*l*. for the erection of a technical institute.

PLANS and sections of the following proposed new buildings, &c., in Dundee, lodged at the office of the city engineer, were submitted to a meeting of the works committee of the Town Council, and were approved:—Arbroath Road, cottage for Geo. Patterson; Dundonald Street, mechanic shop for F. S. Sandeman & Sons; Hawkhill, hall for the Rev. J. H. Shepherd; High Street, Lochee, alteration on shop for Charles Batchelor; Lytton Street, skating rink for Wilbur Harlan; Old Glamis Road (off), shed for the trustees of the late John Johnston; Strathmartine Road, Downfield, additions to school for Mains and Strathmartine School Board.

VARIETIES.

THE Portsmouth Town Council are considering possible sites for a new elementary school to be erected at North End.

STRATTON workhouse, Wiltshire, is to be illuminated by electricity.

THE Carpenters' Company have arranged for a course of five lectures on sanitary building construction to be delivered at the Carpenters' Hall in October and November.

THE Greenock Corporation have, after visits to various towns, agreed to erect new mechanical filters, and have accepted the tender of Messrs. Bell Bros., Ravensthorpe, for the work, amounting to 6,280*l*.

THE Chertsey Rural District Council, Surrey, propose, subject to the consent of the Local Government Board, to present 50 guineas to Mr. W. Durrant, the surveyor, who is retiring after forty years' service.

THE sanitary committee of Bristol report that nine streets need reconstruction, and the cost of pitching eight of them and macadamising the ninth will amount to 4,917*l*., of which sum 1,000*l*. is recommended to be expended on Victoria Street, St. Philip's.

THE War Office has decided to carry out a searching inspection of all the barracks in the United Kingdom with a view to remedying sanitary and other deficiencies. It has long been notorious that some of the barracks were in urgent need of improvement, and in some cases of demolition. The cost of the work is to be spread over a number of years.

THE water supply arrangements of the town of Zanzibar are to be improved at a cost of 16,000*l*. The existing aqueduct is to be replaced by iron pipes, and a tower is to be erected at a short distance from the town, into which the water can be pumped, and from which it can be carried by gravitation into all parts of the town.

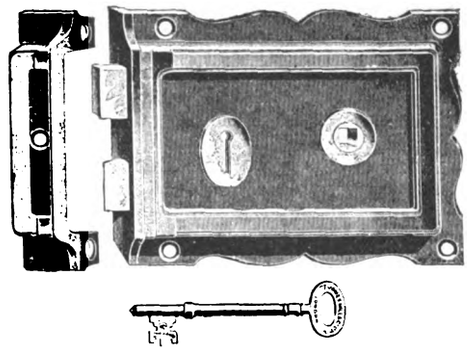
The Rothesay Town Council at an unofficial meeting last week passed a resolution approving the erection of a building on the Front as a shelter. A plan was submitted for a glass and steel erection by the Falkirk Iron Company, which with verandah all round would cost about 4,000*l.*, and could be put up in five months.

The Barry District Council last week had before them the question of the development of Barry Island, when it was suggested that the surveyor should prepare plans and estimates for the construction of a sea wall, and that Mr. W. T. Douglass, M.Inst.C.E., Westminster, be also engaged to confer with the surveyor with reference to the scheme he had prepared three years ago. It was decided that four members visit other seaside resorts where sea walls have been built. Mr. W. T. Douglass was appointed consulting engineer.



The streets committee of Kirkcaldy Town Council have had under consideration proposals submitted by Mr. W. Lockhart, C.E., with the purpose of providing a scheme of drainage to deal more adequately with the present requirements of the burgh, as well as to provide for the probable extension of the town within the next thirty or forty years. He also submitted several methods by which the present contamination of the beach by sewage could be avoided. Two schemes were submitted, the first being estimated to cost 34,000*l.*, and the other 19,000*l.* The committee decided to meet with Mr. Lockhart and discuss the question.

The opening ceremony of the Palmer's Green Congregational Church took place on Tuesday. The building, which is the first portion of a larger scheme and will eventually be used for school purposes, is designed in a later period of Gothic freely treated. The whole of the tracery work in the windows and other dressings are executed in Bath stone and the facings in red pressed Leicester bricks; the roof is covered with tiles; the internal joinery is carried out in oak; the heating, lighting and ventilation are carried out on the most modern and approved lines. The contract has been carried out by Messrs. Mattock Bros., of Wood Green, N., from the designs and under the superintendence of Messrs. George Baines & Son, of 5 Clement's Inn, Strand, W.C.

The "Harvard" House, Stratford-on-Avon, is to be opened as an American possession on Tuesday next by the American Ambassador. This half-timber house was erected in 1596 for Alderman Thomas Rogers, the grandfather of John Harvard, the founder of Harvard University, U.S.A. It was recently purchased by Mr. E. Morris, of Chicago, and after extensive and careful restoration it was presented by him to that University with a view to it becoming a museum of Harvard relics. Visitors will notice especially the fine raftered ceiling on the ground floor, and the beautiful Elizabethan oak-panelled room on the second floor, with its curious Tudor plaster mantel beading. For the opening ceremony on Wednesday the Great Central Railway Company are issuing special tickets available from London (Marylebone) to Stratford-on-Avon and return at a fare of 6*s.* 6*d.* by the express leaving at 10 A.M. and reaching Stratford-on-Avon at 12.21 P.M. The return from Stratford-on-Avon can be made at 4.35 P.M. or 7.27 P.M., reaching London at 6.43 and 9.55 P.M.

NOTES ON NOVELTIES.

Messrs. James Hill & Co., Ltd., ironmongers and hardware merchants, 100A Queen Victoria Street, E.C., are the original inventors of the reversible system for rim locks. We

here illustrate a new registered design. The lock is fitted with a new patent ball-bearing action, and is made in dull art black with brass bolts, or of brass entirely. It is worthy of mention that Messrs. Hill & Co. give a guarantee of

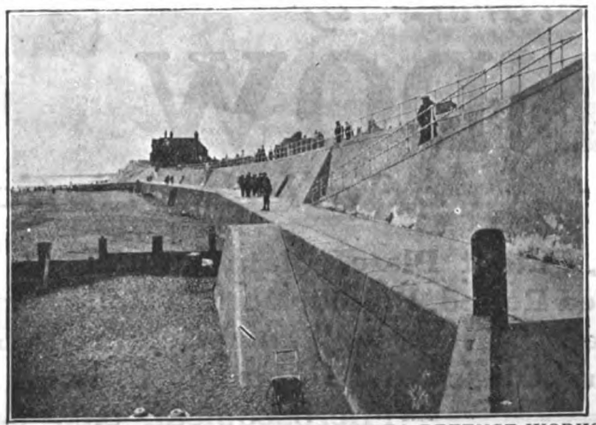
twenty years' wear with all "E. C." ball-bearing locks, and undertake to repair any lock that has got out of order through faulty workmanship.



The "Gradiograph" is the name of an instrument for sewerage and other work made by A. G. Thornton, Ltd. Its primary purpose is for accurately setting out the levels of drains and sewers without recourse to the usual cumbrous system of sight rails and boning rods. Its over-all measurements are 36 inches by 3 inches by 1 inch in thickness, and the total weight is 7 lb. It consists of an elongated nickel aluminium casing of rectangular section. The casing inside is very accurately machined and adjusted. A perfectly graduated steelyard is pivoted towards one end at a point that coincides with zero, and is marked in units and half units, from 30 to 305; above the pivot and attached to it is a sensitive bubble. Travelling along the steelyard is a cursor or traveller which can be adjusted to any intermediate gradient, such as 1 in 98.7 or 1 in 296.8. At the extreme end is a notch or recess, and when the cursor is placed in this position the instrument is converted into a very reliable level for ordinary work. The Gradiograph has a range of gradients from 1 to 30 to 1 in 305, but the graduations on the steelyard can be arranged for different gradients. It is used on the invert of the pipe, and not on the outside surface, and is especially adapted for use where pipes are laid in a heading. Where a sewer or drain is laid by its use every individual pipe has exactly the same fall. Any irregularities on the invert are at once discerned, and can be allowed for in the laying. The instrument has already won much praise from many surveyors and contractors in the neighbourhood of Messrs. Thornton's works in Manchester.

Another draught excluder for outside and inside doors and windows has been put on the market by the Patent Draught, Damp and Dust Excluder Company, Kidwelly. The patent consists of an inverted V-shaped floor plate of brass (filled in with wood) fixed on to the threshold and in the door frame. This is overlapped by a sloping piece of brass screwed on to the door 3½ inches from the bottom. This curtain is itself in two interlocking pieces, the lower of which turns on an axis so that when the door opens inwards the lower brass tilts up and rides over the floor plate.

It is difficult to see how the cunningest draught, the hardest rain, or the finest dust could force a way past these defensive outworks. The fixed floor plate alone should prevent it, for it meets the doors about one-third of an inch from the bottom crack.

BUILDING TRADE AND THE BUDGET.

The serious matter of unemployment in the building trade, resultant upon the socialistic Budget proposals of Mr. Lloyd George, has been already ventilated in the Press. Concrete proof, however, of how far-reaching and how deep-set is the trouble is afforded in a number of letters received from various firms in the building trade, extracts of which, published below, serve to indicate that the Budget has already thrown out of work about half the labourers employed upon building work in the vicinity of London. The letters have been received by the Budget Protest League at Caxton House, Westminster, S.W. In another part of this paper we print a statement published as the result of a conference in South London of builders, estate agents, and auctioneers.

Mr. A. A. Wellings, of Earlsfield, S.W., adds to his facts the subjoined all too patent prophecy:—

"During the latter part of last year and the early part of this year I was financing four builders, who in return employed some 600 men. At the present moment only some 110 men are employed; the others have had to be dismissed and in most cases are swelling the ranks of the unemployed. Last year I purchased three small estates amounting in all to about 10,000*l.*, but in the light of proposed drastic legislation it is not my intention to purchase further building estates, although land is considerably depreciated in value since the introduction of the Finance Bill. Owing to the inactivity in the building trade I am confident that there will be more distress among the working classes this year than in any previous year."

Mr. Bertram T. Rumble, Manager and Secretary of the Merton Park Estate Co., of Merton, writes:—

"As perhaps you are already aware, my company are the owners of between 500 and 600 acres of land in this parish apart from the existing house property, which is considerable, and my directors decided that in view of this Budget, which will weigh so heavily upon them, they could not possibly continue building. In fact, the buildings which were in the course of construction have been stopped, and proposed buildings held in abeyance, until something is definitely known with regard to the Land Clauses in the Finance Bill. I may also mention that my company have had a considerable number of applications for land and houses, and in view of the provisions of the Bill they have not felt inclined to carry these negotiations through.

"The shrinkage of labour on this estate caused by my directors' decision is practically 80 per cent.—that is to say, whereas we were employing a number of bricklayers, carpenters, plumbers, labourers, &c., we are now employing only decorators on the already built properties."

Owing to large contracts at Aldwych and Mill Hill, Messrs. C. Rawley Cross & Co., of Chancery Lane, W.C., are not yet so seriously affected as they apprehend to be later. Nevertheless they have been compelled by the Budget to reduce the number of hands they employ on building operations from some 400 to between 200 and 250:—

"At a rough guess we should say we were responsible directly and indirectly for the employment of about 350 to 400 men up to the end of last year. Since the Budget was introduced there has been a considerable falling-off, although at the moment we are busier, as we are covering a site in Aldwych and are erecting some thirty or forty houses at Mill Hill. We should say that altogether there are not more than 200 to 250 employed. We have certainly not bought any land since the Budget was introduced, and should be only too glad to get out of what we hold. In reply to other questions, business is bad."

Mr. Edwin Evans, of Lavender Hill, in the course of his letter on the subject, states the case very succinctly:—

"I have had some figures taken out for the first eight months of this year for the purpose of comparison with those for a similar period of last year. I find that there is a diminution of about 20 per cent. This proportion will be greatly increased as time goes on, because we usually purchase some 200,000*l.* worth of land per annum, and we are not buying now in consequence of the iniquitous Budget proposals. Should the Finance Bill ever be placed on the Statute Book, its operation would reveal the fell intent of the Government in all its nakedness, and the country would realise the true character of a Socialist Government."

Messrs. Swain & Selley, of Streatham, append to their letter the following brief statement of what the Budget has already done in reducing employment with them, and what

its effect will be in December. The figures speak so plainly for themselves that comment in the premises seems superfluous:—

Average number of men employed for five years previous to April, 1909	200
Present number actually employed	100
Estimated number at present without Budget proposals	200
Anticipated number in December 1909 ...	60
Estates bought	None
Sales	Bad

Mr. Henry Watts writes of his own case as follows:—

"I can assure you that at the present time I do not employ one half the number of men I was employing six months ago; for instance, in the second week in March last my wages account was 178*l*. 13*s*. 4*d*., whereas in the second week of this month it was 85*l*. 7*s*. 8*d*.; the number of men employed in March last was about eighty-nine, and the number of men this month about forty-three, so that this means a falling off of forty-six men; in fact, if it were not for keeping on old hands I should feel inclined to close my building operations entirely. In my opinion the proposed Budget is the cause of this slackness of business. Apart from this, I consider that the proposed increment duty on land will so affect future transactions that I shall have to consider my position fully before taking further land for development, as risks would be increased 20 per cent. I have had parcels of land offered to me at a price that in normal times I should have had no hesitation in dealing with, but, with the additional risks and with such a slump in business generally, it would be madness to entertain any further responsibilities until matters are more settled."

In the course of a letter giving other details on the subject, Mr. F. C. Coad, of Carminia Road, Upper Tooting, writes of the Budget:—

"I may add that bad as it would be for both developer and builder, it will be far worse for the actual worker, and I hate to think of the coming winter. I had an experience last winter. I never thought I should see so many starving men begging for work as I saw then, but I am afraid this winter will be much worse."

LONDON MASTER BUILDERS' ASSOCIATION.

The usual monthly meeting of the Council was held on Thursday, 16th ult., presided over by the President, Mr. F. G. Rice.

The President reported to the Council upon the visit of Belgian Master Builders to London and the steps taken to make the visit a pleasant and useful one. Much gratification was expressed at the results, and the Council passed a vote of thanks to the President and sub-committee for their successful arrangements of the receptional dinner given to the visitors, numbering about 100, at the St. Ermin's Hotel, Westminster, when a good many members of the London Master Builders' Association and ladies were present. The following telegram, received from the President of the Antwerp Association of Master Builders, was read:—

"Dover Pier: August 15, 1909.

"To Mr. Rice, president London Master Builders' Association,—Before leaving England the Belgian master builders wish to send to your association their brotherly salute with the expression of their feeling of gratitude for your kind reception, which they will remember for ever.—Heisbain."

The chairman of the organisation committee (Mr. F. Higgs) reported to the Council the recommendations of this committee, which, after considerable discussion, were agreed to and instructions issued to give due effect to their adoption.

In response to an invitation from the president of the Quantity Surveyors' Association the president (Mr. F. G. Rice), Mr. Frank May, Mr. Benjamin I. Greenwood, and Mr. G. Bird Godson were selected to represent the L.M.B.A. at a conference, *re* tendering without quantities being supplied, on Wednesday, October 13.

Legal matters of considerable importance to the trade were discussed and referred to the solicitor for consideration and report.

The secretary reported that the new agreement between the National Federation of Building Trade Employers and the National Association of Operative Plasterers was signed by the respective delegates with the following provision required by the Council of the L.M.B.A. duly inserted:—

"That it be an instruction in signing the amended

The Reading education committee have received the approval of the Board of Education to the plans for new class-rooms and alterations to the main block at Reading school; also sanction to a loan of 3,283*l.* for the building of the junior school.

Among the amendments to the Housing and Town-Planning Bill which Lord Camperdown put down was the following clause to define the working class:—"The expression 'working class' throughout the Housing Acts, unless the context otherwise requires, shall mean mechanics, artisans, labourers and others working for wages, hawkers, costermongers, persons not working for wages but working at some trade or handicraft without employing others except members of their own family and persons whose income does not exceed an average of 30*s.* a week and such persons as may be residing with them."

Last week at Loughlinstown workhouse, Mr. Francis J. M'Carthy, Local Government Board Inspector, conducted the inquiry into an application by the Rathdown (No. 1) Rural District Council for a loan of 28,200*l.* to be expended upon the erection of 119 labourers' cottages in various electoral divisions of the district, and attaching suitable plots of land to each cottage.

THE HOUSING OF NAVVIES.

(Concluded from last week.)

Colonies of navvies may be the means of importing and spreading infectious disease. There is especial danger in respect of small-pox, to the infection of which navvies are particularly liable.

The Labour Market for Public Works.—The highly mobile condition of this industry and the lack of proper organisation seriously affect the problem under discussion. Employment on public works is of necessity subject to marked fluctuations in respect of time, place, and seasonal conditions, but the difficulties thus arising are needlessly enhanced by the fact that no properly collected and co-ordinated information as to employment can be obtained, and the supply of labour is left very much to chance.

A strong and steady navvy can, as a rule, obtain work readily enough, but although the supply of casual and irregular labour is in excess of the demand, it is often difficult for a contractor in the present absence of properly organised information to obtain a sufficient supply of competent labour. Hence, in order to ensure a reserve on which to draw, some contractors allow advertisements to remain in the "Labour News" even after the requisite number of men have been obtained, and in some cases good workmen are attracted only to find that their services are not required.

Need for a Labour Exchange.—In no other industry is the need for the regularisation of employment by means of a national Labour Exchange more plainly manifest.

The following are the sections in the Port of London Act referring to the engagement of casual labour:—

Section 6.—(1) (ii) An order authorising the construction of new works shall impose on the Port Authority an obligation to provide such housing accommodation for the persons to be employed at the new works when constructed as the Board of Trade may from time to time consider requisite.

Section 28.—(1) The Port Authority shall take into consideration the existing methods and conditions of engagement of workmen employed in dock, riverside, and warehouse labour in connexion with the Port of London, and shall, either by themselves or in co-operation with other bodies or persons, by establishing or maintaining or assisting in the establishment or maintenance of offices, waiting-rooms, and employment registers, and by the collection and communication of information and otherwise, take such steps as they think best calculated to diminish the evils of casual employment, and to promote the more convenient and regular engagement of such workmen or any class thereof:

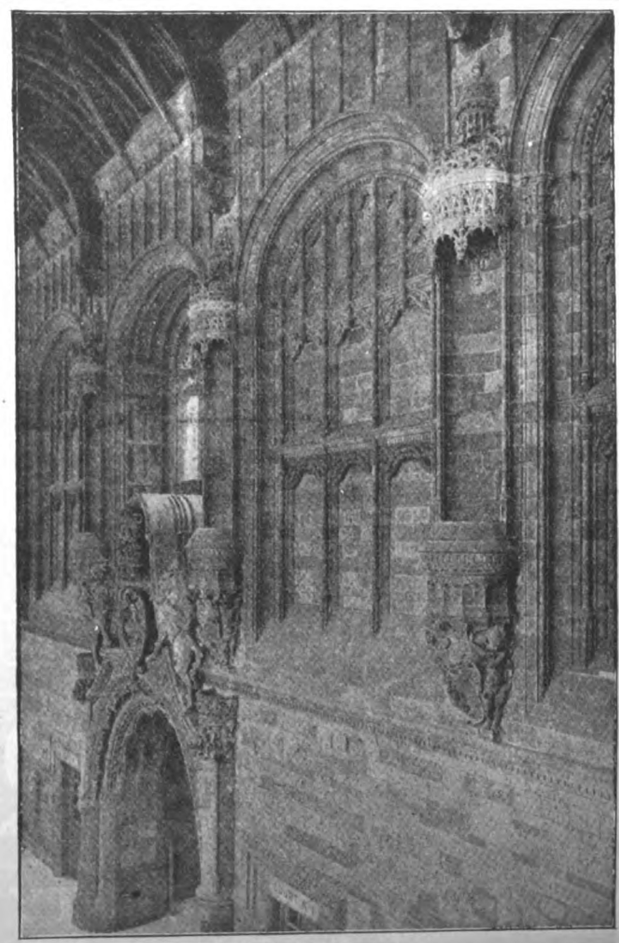
Provided that nothing in this section shall deprive any person of any legal right which he would otherwise possess with regard to the engagement of labour.

(2) The Port Authority may make bye-laws with respect to admission to, and the maintenance of order in, such offices and waiting rooms, and otherwise for the purpose of carrying this section into effect.

A Bill to provide for the establishment of Labour Exchanges is now before the House of Lords, having passed the House of Commons.

Cheap Railway Fares.—Having no trustworthy means of finding out where work is to be obtained, many navvies (perhaps the majority) now tramp from one public work to another on the strength of vague rumours. This statement applies not only to shiftless and casual workers, but even to strong and steady men, who, though their chance of obtaining work may be good, yet do not care to expend money on railway fares unless they can be certain of employment. To be able to secure engagement by means of a Labour Exchange, and to be forwarded cheaply by rail to where their services are required, would be a great boon to this class.

"*Subbing.*"—One of the worst influences affecting the moral and social conditions of navvies is the practice of "subbing," or paying instalments of wages daily, or at short intervals, instead of the whole wage weekly or fortnightly. The practice came into vogue when wages were paid at monthly intervals. Wages are now, as a rule, paid weekly, but men are often allowed to "sub" daily to within 6*d.* or less of the full amount due to them, a few pence being withheld in order to keep the workman's name on the pay-sheet. When men arrive penniless on public works it is necessary that they should at first receive an instalment of their wages to enable them to obtain food and lodgings, but this advance is not required by steady men after the first week, or, at most, two weeks.



Some of the best contractors refuse to "sub" after the first week, and in consequence generally retain a superior class of men on their works.

Recommendations.

1. That every corporate body or contractor intending to commence works of public construction involving the employment of navvies, on which any number of workmen exceeding 100 not previously resident within three miles of the works shall be employed, should be obliged to notify the Local Government Board, and also the County Council, or the sanitary authority of the district of such intention, not less than fourteen days before the commencement, indicating the general scope and the probable duration of the work, and approximately the number of workmen it is intended to employ. If at any subsequent date a larger number of workmen shall be employed than were specified in the original notification, a further notification specifying approximately the number should be made. On the completion of such works the central and local authorities should again be notified.

2. That such works should from time to time be open to inspection by inspectors of the Local Government Board.

3. That contractors should endeavour to arrange with the railway companies for the granting of specially cheap fares to workmen.

4. That workmen should, if necessary, receive instalments of their wages during the first fortnight of their employment, but that after this time wages should be paid weekly, and that no contractor should advertise "Sub Daily" as an inducement to attract labourers to any work.

5. That any employer of labour on works of public construction who shall employ any number of workmen exceeding 100 not previously resident within three miles should, unless sufficient and satisfactory accommodation already exists, be obliged to provide accommodation to the satisfaction of the County Council or the District Council. The temporary buildings to be provided should, unless the duration of the work is likely to be very short, include buildings sufficient for the isolation of cases of infectious disease that may occur among the workmen or their families.

Temporary buildings provided should be registered by the County Council or the District Council, and should be open to inspection by either of these bodies.

If, however, temporary buildings be erected within three miles of any part of the works, for the accommodation of workmen by private persons, these may, if approved by the County Council or the District Council, be accepted in lieu of provision made directly by the contractor or employer.

6. The medical officer of health for the district should, when such temporary buildings are first erected, and afterwards from time to time, examine and report whether in respect of construction, lighting and ventilation, water-supply, drainage, and excrement and refuse disposal these buildings are of a satisfactory character, and whether the cubic accommodation of the sleeping apartments affords not less than 300 cubic feet of free air-space for each occupant.

7. The provision of the necessary temporary buildings should, unless the duration of the work is likely to be very short, include the provision of a suitable room for recreation.

8. Temporary sheds in which meals can be taken and food warmed should be provided.

9. On all works on which more than, say, 200 men are employed a canteen should be provided in which light refreshments and non-intoxicating liquors may be sold. If intoxicating liquors are sold the manager should receive no profit on and have no interest in the sale.

10. No intoxicating liquors should be allowed to be sold in any temporary building other than the authorised canteen.

11. A clause requiring the provision of accommodation on the lines above laid down should as far as practicable form part of all contracts and all Acts of Parliament authorising public works of construction.

The Limerick District Council are considering a scheme for the erection of a bridge across the river Shannon at Castleconnell at a cost of 12,000*l.*

The Newcastle-on-Tyne Board of Guardians have agreed upon the expenditure of 11,700*l.* on the extension of the cottage homes at Pontelands.

A site has been purchased in Pinner Road, Oxhey, near Watford, Herts, for the erection of a parish hall.

Plans for an extensive improvement of the Worthing pier have been approved by the Town Council.

Plans submitted by the Rev. G. F. Eyes, M.A., for a new church of St. Philip's, Swan Lane, Bolton, have been approved.

Or about 2′ 9″ to 2′ 10″ Centres.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed ; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

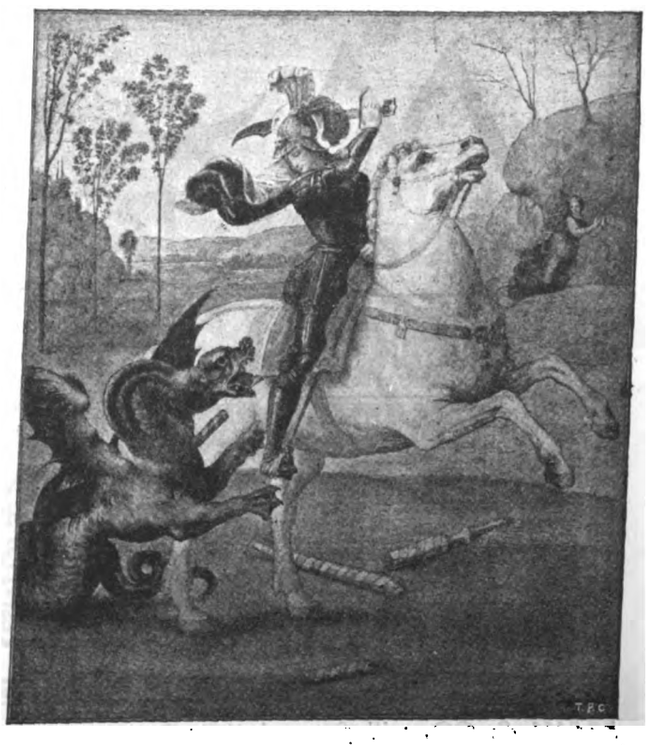
Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.

***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.



OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.* AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

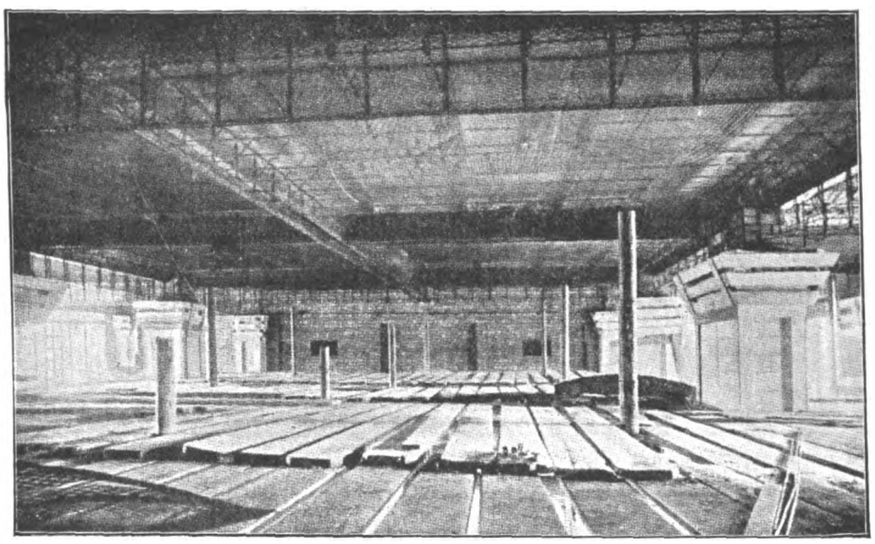
Galatea.

From the Painting by RAPHAEL in the Villa Farnesina, Rome. Size 30 in. by 22 in. Price Two Shillings. Free by post, carefully packed inside patent roller.

St. George.

From the Painting by RAPHAEL, in the Louvre. Size 15 in. by 20 in. Price One Shilling and Sixpence. Free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the



Publisher, P. A. GILBERT WOOD, Imperial Buildings, Ludgate Circus, London, E.C. (*FULL LISTS ON APPLICATION.*)

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

The Mansfield Board of Guardians have decided to erect new quarters for the children at a cost of 1,150*l*.

The Tamworth Board of Guardians have agreed to provide a new laundry. The outlay inclusive of the machinery will be 1,841*l*.

The Local Government Board forwarded their sanction to the borrowing by the Birkenhead Town Council of 18,723*l*. for the erection of the Brassey Street Council School, the tender having been secured by Mr. Peter Rothwell, of Birkenhead.

Glasgow Dean of Guild Court last week granted the following linings:—Queen's Park Football Club, to erect pay entrances and exit gates in Somerville Drive; Richard Henderson, architect, 116 Hope Street, to erect six tenements of shops and dwelling-houses in Cathcart Road and Carmunnock Road; Alexandra Park Property Company to erect six tenements of dwelling-houses on the north side of Cumbernauld Road; the Petershill Building Company, 107 Bath Street, to erect a tenement of dwelling-houses on the east side of Bedlay Street, Springburn.

The public baths committee of the Nottingham City Council recommend the erection of swimming and other baths on a site containing 2,200 square yards at the south-west corner of their Meadows Cricket Ground. The city architect has prepared a sketch plan of the proposed baths, and this has been approved of by the committee. It is estimated that the cost of the building and engineer's work will be 9,000*l*. It is proposed that the swimming pond shall be 100 feet by thirty-six feet, that there shall be soap baths and sanitary conveniences, five private baths for ladies, with waiting-rooms, &c., ten private baths for gentlemen, with waiting-rooms, &c., a boiler house, and ticket office and store-room.

The Plumbers Company, of which the Lord Mayor (Sir John Knill, Bart.) is Master for the third time, at their quarterly meeting appointed a committee to examine the note-books and drawings of the plumber apprentices attending the technical classes, whose names appear on the company's register of indentured apprentices. The committee were instructed to report to the court with a view to awards being made upon the report of teachers as to the attendance of the apprentices and their progress in practical workmanship.

SHEET LEAD as an effective and for **"ALL TIME" Damp Course** cannot be surpassed.

HOFLER'S DAMP COURSE

consists of a continuous sheet of lead foil, protected between two layers of fibrous asphalte sheeting.

Made in all wall widths, and up to 39 inches wide. In rolls 66 feet long, without a joint, it may consequently be specified with confidence.

BUILDING AND BUILDERS.

The Church Council connected with St. Mary's, Barnsley, have decided to build a new boys' school at a cost of 4,000*l.*

The Blantyre School Board, N.B., last week agreed that an elementary school to accommodate 500 pupils and an intermediate school of eight class-rooms to accommodate 320 pupils, together with a janitor's house, be built on the same site. The cost of the elementary school, it was agreed, was not to exceed 10*l.* per pupil, and the intermediate school (exclusive of janitor's house) not to be more than 5,000*l.* A site will have to be purchased.

Arrangements have been completed for the erection of a new skating rink at Burton-on-Trent. The outside dimensions will be 150 feet by 82 feet, and the rink itself will be 140 feet long and 60 feet broad, giving an area of 8,400 square feet. It will be oval in shape, and clear of all supports. In Bath another skating rink is to be opened in the convenient site of James's Street, situate on the Midland Railway's land. It will be equipped with rock maple floor of 22,000 square feet, laid with two thicknesses, with a layer of felt to reduce to a minimum the noise and vibration. Ground has been leased by Mr. James Watson, builder, Uddingston, N.B., to a London syndicate for the erection of a large roller skating rink, with ante-rooms and orchestra platform. The site is practically in the centre of Kyle Park villa district.

Mr. A. A. Hudson, Board of Trade arbitrator, who sat at Swansea as umpire in a dispute between the master builders and plasterers, and which caused a strike of twenty weeks, gave his award last week. The men, who were paid 8½*d.* per hour, claimed an advance of 1*d.* per hour and an alteration of working conditions. The award provides that from April 1 to the end of September the men are to work fifty-four hours per week, from the first to the last day of October and the first to the last day of March fifty-one hours a week, November and February forty-eight hours, December and January forty-two and a half. Under the old arrangement men worked fifty-two hours a week all the year round, and the award reduces the number to 51 5-12 hours per week. Wages are increased ¼*d.* per hour, or about 1*s.* 1*d.* per week.

A manifesto has been issued by the North London building trade strongly protesting against the Land Clauses of the Finance Bill. The document reads:—"We have already suffered considerably by the proposed measure. Since May last to the present date our sales of houses are much less than for the same period last year. Not one of us has made any purchases of land, nor can we do so if the Government insist on taxing us twice over for our raw material—*i.e.*, land—and, what is worse still, seeking to take 20 per cent. of our profits (where we have the good fortune to make any), and taking no account of our losses or depreciation in value of our stock account, land and houses in hand. No business man could work under such conditions, especially since the Chancellor of the Exchequer has declined to allow interest on capital before assessing the increment duty."

The Glasgow Dean of Guild Court have published a report showing that during the year ending August 31 last 368 linings were granted by the court, representing property to the value of 902,613*l.*, while the total valuation of the subjects dealt with during the previous year was 894,716*l.* The increase in the valuation of the work passed by the court during the year is accounted for by the number of public buildings for which linings were granted. So far as these were concerned the total valuation of the new work amounted to 157,522*l.*, and of the additions and alterations to 26,485*l.* In the previous year the valuation of the work passed in this class was only 59,875*l.* The total number of linings granted for all classes of building property was 187 for new work and 182 for additions and alterations, the valuation of the former being 792,402*l.*, and the latter 110,211*l.* The valuations of the tenement properties in the various districts were 335,970*l.* for new work and 10,422*l.* for additions and alterations made up as follows:—Central, new work, 2,000*l.*; additions and alterations, 1,275*l.* Western, new work, 10,530*l.*; additions and alterations, 1,323*l.* Eastern, new work, 44,714*l.*; additions and alterations, 692*l.* Southern, new work, 6,690*l.*; additions and alterations, 1,032*l.* Northern, new work, 11,600*l.*; additions and alterations, 191*l.* St. Rollox, new work, 41,579*l.*; additions and alterations, 1,787*l.* Queen's Park, new work, 106,062*l.*; additions and alterations, 1,952*l.* Maryhill, new work, 112,795*l.*; additions and alterations, 2,170*l.*

VARIETIES.

The Guildford Board of Guardians have resolved to borrow 3,075*l.* for the erection of a receiving home for children.

The Chesterfield Rural District Council are to apply to the Local Government Board for a loan of 20,000*l.* for an improved water supply to the villages in their southern district.

The Scarborough entertainments committee have adopted a scheme for the erection of a pavilion in the Alexandra Gardens on the North Cliff, at a cost of 2,500*l.* The Town Council's approval is required.

Mr. Walter Emden is to be presented with the freedom of the borough of Dover in recognition of his services and of the fact that he has been elected Mayor for the third year in succession.

The Bridlington Town Council at their last monthly meeting unanimously decided to spend 3,000*l.* on extensions at the electricity works, and by a large majority decided not to undertake a municipal housing scheme at the Old Town.

The sanitary committee of the West Bromwich Town Council report that the Local Government Board have sanctioned the borrowing of 11,000*l.* for the destructor and the use of the land at the electricity works for the site.

Newcastle-on-Tyne town improvement committee, on Wednesday passed plans for the new entertainment hall and roller skating rink in Northumberland Road, Newcastle, and for a picture hall in Long Row, Byker.

The Irvine Dean of Guild Court have just passed linings of a new post office for Irvine to be erected by Mr. Gavin Ferguson at 157 High Street, Irvine, on the site of the present Montgomerie Estate Office, at a cost of 1,500*l.*

The Mersey Docks and Harbour Board have adopted the recommendation of the works committee to provide, in lieu of the refuse destructor recently authorised to be erected in Lightbody Street, a destructor of greater capacity at an estimated additional cost of 7,700*l.*

The Herne Bay Urban District Council have purchased the pier for 6,000*l.* It is proposed to improve and widen the shore end, to erect a concert pavilion for 2,000 people, and a landing stage for the largest passenger boats. The Local Government Board have granted a loan of 26,000*l.* for the work.

Mr. Harry W. Taylor, A.M.I.C.E. (Messrs. Taylor, Wallin & Taylor, of Newcastle and Birmingham), has been appointed by the Kelso Town Council to report upon the proposal to obtain a water supply by gravitation from the Cheviot Hills. The existing supply to the town from the Tweed has become polluted.

The Clyde Trustees, at a meeting in Glasgow on Tuesday, agreed to a scheme for utilising the new quayage at Meadowside for the discharge of grain cargoes. The scheme involves the erection of a large goods shed and a granary, and the provision of elevators and all necessary appliances, operated by electricity, for the speedy unloading of vessels. The cost will be over 100,000*l.*

Messrs. William Whiteley, Ltd., have declined to pay to the Paddington borough council 82,000*l.* (the minimum price fixed by the Local Government Board) for the Queen's Road baths and freehold site, as they consider this sum to be "greatly in excess of the actual value of the property." It had been provisionally agreed that they would pay 60,000*l.* The bath committee now recommend inviting tenders for the property. It is intended with the proceeds to erect new baths and washhouses.

The Edinburgh Town Council have inspected three projects prepared by the burgh engineer for the heightening of the parapet at the Dean Bridge with a view to the prevention of suicides. They are as follows:—To make an entirely new parapet and coping of an equal height, 4 feet 6 inches; to hew the present base level, and superimpose upon the parapet blocks of similar shape to the first proposal; or to erect a parapet with ornamental buttress spaces.

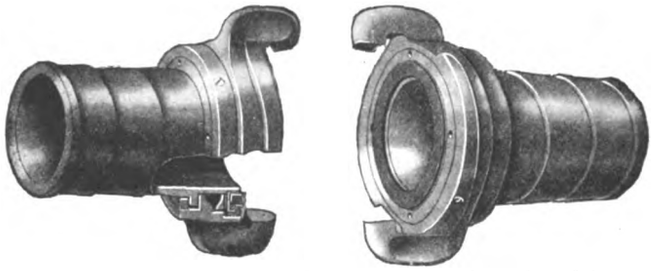
Dublin has temporarily returned to the not far distant past when the Liffey was a cesspool giving off poisonous vapours. By the new main drainage works, which were opened in 1906, after an outlay of over half a million sterling, the sewage passes from the city by gravitation to Pigeon House Road, where it is pumped to the precipitation tanks of the fort. But recently the eight-foot main drainage sewer became choked by the accumulated deposits from the old city sewers, and it was ascertained that about 5,000 tons of matter had become embedded. As a consequence the

Digitized by Google

crude sewage was forced into the Liffey. It is expected that the necessary cleaning-out will not be finished for three or four months.

The executive committee of the Garden Cities and Town-planning Association (an entirely non-party organisation) after considering carefully the effect of the amendments made in the House of Lords to the Housing, Town-planning &c., Bill, has unanimously passed the following resolution:—"That this Association hopes that every effort will be made to carry the town-planning part of the Housing, Town-planning, &c., Bill into law during the present Session of Parliament, and hopes that some agreement may be arrived at between the Government and the House of Lords whereby delay and expensive or cumbrous procedure in regard to town-planning schemes may be as far as possible avoided."

The Blue Book issued on Wednesday, commences a new series of workmen's compensation statistics, as 1908 was the first complete year during which the extending Act of 1906 was in operation. The gross total of compensation paid under the Act was 2,080,672*l*., and represented 3,473 cases of death and 325,484 cases of disablement. The figures do not include payments made in cases outstanding under earlier Acts, &c. In quarries the amount of compensation paid in respect of the accident cases was in respect of the 88 fatal cases 11,501*l*., an average of 131*l*. per case; in respect of the 5,284 disablement cases 23,056*l*., an average of 4*l*. 7*s*. a case. The returns relating to constructional work, such as the construction of railways, tramways, bridges, harbours, docks, &c., show 119 fatal cases, with compensation 13,551*l*., and 6,805 disablement cases with compensation 38,269*l*. In addition 108*l*. was paid for industrial disease, a total of 51,928*l*. for the year.



At a meeting of the Cardiff Museum Committee on Friday Mr. J. Ward, the curator, reported upon the recent excavations at Gelligaer, and said that four examples of Roman baths had been discovered, plans of which were submitted. Good examples of architectural work had also been found. The most important find, however, was the part of a large stone inscription referring to the Emperor Trajan when he was consul for the fifth time. This would be, perhaps, about 110 A.D., and gave them the first clue as to the age of the fort. In the course of further business a member asked if anything more had been heard of Mr. Edwin Seward's claim against the Museum Committee. The chairman replied that a sum of 1,100*l*. was tendered to Mr. Seward in bank notes, but he declined to accept them, so the bank notes were returned to the city treasurer.

The autumn season at the Leicester Galleries, Leicester Square, will open on the 16th inst. with an exhibition of paintings, drawings and etchings by Mr. William Strang, A.R.A., LL.D. The collection will include the portrait in oils of the late George Meredith painted by Mr. Strang last year, which has not been previously exhibited. There will also be shown a series of water-colours illustrating "Rubáiyát of Omar Khayyám" by Mr. Edmund Dulac, a young Anglo-French artist. In addition Goldsmith's "The Deserted Village" is the subject of a series of water-colours by Mr. W. Lee Hankey.

TRADE NOTES.

The Sussex Portland Cement Company, Ltd., have issued a calendar for the twelve months commencing October 1909. The excellent sketch which accompanies it is of Hever Castle, Kent, with its moat. This building was recently restored under Mr. Frank Pearson, A.R.I.B.A., who employed over 4,000 tons of their "Newhaven" brand of cement on the work.

The Nunan and Stove Hose Coupling, which has been adopted by such navies as the British, Japanese and Russian, as well as by the P. & O., White Star, Cunard and

other steamship companies, has now been adapted and improved by Mr. A. E. Stove for the purpose of domestic use. In its new sphere it should prove of invaluable service. By

this improvement the two sleeves of the old coupling are reduced to one, which revolves by a turn of the wrist and firmly grips the fixed end. The male or female joints, which were apt to become bent and consequently not watertight, are obviated; there are no threads to wear out, and it can be used both for suction and delivery, unlike its predecessor, which was unsuitable for suction. All twists in the hose are instantly removed when the water passes through. The greater the pressure at the coupling joint the greater the water-tightness. The contact is made by a pair of lips which fit securely over a flange. If necessary, the hose can be riveted to the sleeve, which was impossible with the two-sleeve coupling. The coupling can be taken to pieces immediately, and any damaged part replaced. The improvement has been subjected to the most severe tests and has won unqualified approval. The sole manufacturers are Nunan's Hose Couplings, Ltd., 10 Norfolk Street, Strand, W.C.

THE JOHN MORLEY LABORATORIES, UNIVERSITY OF MANCHESTER.

The John Morley Laboratories, opened on Monday last by Sir Henry Roscoe in the presence of Lord Morley, the Chancellor of the University, stand at the south-west angle of the central University site. The main buildings of the original Owens College divide the University group into two large quadrangles. Of these the eastern is that which is separated from Oxford Street by the Whitworth Hall and the museums, the western quadrangle being bounded on the west by the medical school, on the north by Coupland Street and on the south by the group of chemical laboratories. The new buildings form a completion of the south-west corner of this western court as they touch the medical school buildings, being built up against their southern wall, and are in turn connected with the older chemical group, being contiguous to the Schorlemmer laboratory and to the laboratory of the late Dr. Schunck, which was a few years ago bodily removed from its original site at Dr. Schunck's residence. The Morley laboratories besides closing in the large western quadrangle, also form on their southern side a smaller court which will now be entirely surrounded by rooms for chemical purposes. The old gymnasium (now removed) formerly stood on a portion of this ground.

The architect, Mr. Paul Waterhouse, has kept the design of the buildings facing the small court studiously plain, aiming at the maximum of light for the laboratories, with a minimum of expenditure on ornament. On the elevations which face the large quadrangle he has endeavoured to produce a result in harmony with the adjoining designs of his late father, Mr. Alfred Waterhouse, R.A., and though no space or material has been wasted in mere efforts towards effect the octagonal stair turret with its cusped windows and the large gable set anglewise to the main building are specially studied as being intended to form harmonious features in the general group of buildings. On this side the walls are faced with buff bricks, and the window dressings, copings, strings, and other stone work are of Stanton Woodhouse stone. In the inner court ordinary local bricks are used for the facing and the stonework is reduced in quantity.

The principal room in the new block is the large laboratory for organic chemistry. It is 64 feet long, 32 feet wide and 28 feet high. The open timber work of the roof is all of pitch pine, and the use of plaster (as being readily destroyed in the atmosphere of such a laboratory) has been entirely avoided. The windows are as large as possible, there are abundant skylights, and in this room as in all the others, special attention has been given to the extraction both of general air for ventilation, and of fumes from the fume closets with which the walls are lined on both sides. There is also an elaborate system of floor channels for the disposal of sink-drainage. The walls of this laboratory are faced with glazed bricks from floor to ceiling.

The basement below this large room and the whole of the block which connects it with the Schunck laboratory, are almost entirely given up to well-lighted research rooms, the only exceptions being that one room is set aside as a writing room, and that others are devoted to the necessary sanitary accommodation, stores, &c.

That portion of the ground floor which faces north and east is devoted mainly to a large "service room" which is in effect a store room for materials. Adjoining this service room is the corridor leading from the older chemical block, so that the service room is at a point conveniently accessible from the whole of the chemical departments. It is also adjacent to the main new staircase. (There is another minor staircase at the other end of the new laboratories.) Below the service room in a so-called basement, which in reality has large windows practically above ground, forming the important and much-needed extension of the laboratory for "First M.B." students, connecting directly with the older room that has served the same purpose. On the upper floor, above the service room is a group of three private (professors') rooms. One of them is a study, another is a good-sized and well-equipped laboratory, with windows on two sides and a sky-light.

The heating of the whole block is effected from the newly installed general heating plant of the university. The ventilation is independent, being actuated by special fans.

As far as possible the use of plaster and of exposed iron work has been avoided in all laboratories, though occasional use has been made of cement. Wall surfaces are for the most part of glazed or "Premier" bricks.

Messrs. G. Macfarlane & Son are contractors, and the whole work has been superintended by Mr. L. Knowles.

The "Premier" facing bricks came from the Aston Hall Brick Company. The glazed bricks from the South Buckley Brick Company, the constructional steelwork was in the hands of Edward Wood & Co., and the wrought iron balustrades, &c., were made by Hart, Son, Peard & Co., of London and Birmingham. The Crittall Manufacturing Company were responsible for the metal casements and frames.

The presentation key, modelled and engraved in silver, which Mr. Waterhouse, as architect, handed to Sir Henry Roscoe, was made by the Birmingham Guild of Handicraft.

INSTITUTION OF MUNICIPAL ENGINEERS.

Arrangements have been made with the Associated Portland Cement Manufacturers (1900), Ltd., for the members of the Institution of Municipal Engineers to visit the company's works at Northfleet on the 16th inst. The train leaves Cannon Street Station (S.E. & Chatham Railway), 11.42 a.m., London Bridge Station at 11.45, and arrives at Northfleet Station at 12.47, whence the party will walk to the adjacent factory hall—the property of, and adjoining one of the works of, the Associated Portland Cement Manufacturers (1900), Ltd., where luncheon will be served. At 2 p.m. special tram-cars will leave the hall for Swanscombe works, where the party will be divided into sections, each under the guidance of one of the company's officials, who will conduct them and explain the various processes:—(1) The quarrying of the chalk on the properties of the company adjoining the works and the method of amalgamating the chalk and clay in the powerful wash mills and screening mills. The power-house operating this section of the plant is driven by three Oechelhauser gas-engines, each of 400-h.p., which with four more engines of this type, driving grinding mills, have recently been installed at the works; (2) the slurry mixing and storage tanks, the largest having a capacity of 7,000 tons. These contain the mixture as pumped from the wash mills and before being delivered to the rotary kiln plant; (3) the rotary plant, which is the largest in Europe, having a capacity of 7,000 tons of Portland cement per week and consisting of sixteen kilns, each 130 feet in length. The two main steam-engines and generators of 1,000-h.p. capacity each, which provide the power for driving this and other sections of the works, will be seen in the engine-houses underneath the kiln floor; (4) grinding mills. The product from the rotary kilns after passing through the cooling cylinders is conveyed by means of transfer cars and an electric lift to the various grinding mills, where the clinker is reduced to a fine powder in preliminary ball mills and in tube mills for the final grinding. During the latter process the setting time of the cement is regulated to any required degree by means of the hydrating apparatus, which will be shown and explained; (5) the cask making department, capable of turning out over one million casks per annum. The

party will then proceed by a special train of improvised cars over the works railway to the new reinforced concrete jetty which has recently been completed on the banks of the Thames about a mile from the factory. After inspecting the warehouses, the Mason gas-producer plant and the works testing-room, where the setting time, fineness and other characteristics of the cement coming from the various grinding mills are continually being checked, the party will rejoin the tram cars, a comprehensive bird's-eye view of the works and surrounding country being obtained when walking up the hill. At 4.30 p.m. cars will leave Galley Hill, Swanscombe, for the factory hall, where tea will be provided, at the conclusion of which there will be a demonstration of the gauging and testing of Portland cement, including determinations of setting time, soundness, fineness, gauging of briquettes for tensile strength and testing of specimens. There will also be an exhibition of scientific and other special apparatus for the examination of Portland cement. The return will be made at 6.12.

The Monmouthshire County Council are considering a report by Mr. Baldwin Latham concerning the water supply of the western portion of the county. The creation of a joint water board is recommended. Mr. Latham advocates the construction of a single reservoir of 315,000,000 gallons capacity in the Grwyne Valley, Breconshire, at a height of 1,650 feet. The cost of this scheme would be about 250,000*l.*

A special meeting of the Tonbridge Urban Council considered last week the report of the committee on the sewage disposal. They recommended that centrifugal pumps be obtained for pumping upon low land, and ram pumps for the high land; that the pumps be operated by suction gas, and that the present town gas be utilised for starting the engines and for storm-water pumping. The committee further recommended that application be made to the Local Government Board for sanction to borrow 8,500*l.*, made up as follows:—Alteration to existing buildings, to enable the new pumping plant, engine beds, &c., to be put therein, 6,499*l.* 12*s.* 8*d.*; pumping plant, 1,845*l.*; contingencies, 155*l.* Some discussion ensued, and ultimately it was agreed that electrical power should be used.

GAS-STEAM RADIATORS.

On the unimpeachable authority of a Royal Commission it is calculated that the unworked coal supply of Great Britain is sufficient, after allowing for an average increase, to last for 500 years more. That estimate is a conservative one, for there is every reason to assume that the consumption of coal will decrease in proportion as its use increases. A millionaire mustard-maker once explained that his fortune was made not by what was eaten, but by what was left on the plates. So likewise the collieries have been kept busy in supplying the coal that was wasted by millions of fire grates, furnaces and boilers. Now science has been brought to bear on the subject and has begun to devise means of getting more and more value out of coal. Gas stoves and fires have for a good many years been irresistibly advancing in popular favour. A later development is here illustrated; it is a Richmond's "Monarch" gas-steam radiator.

As will be seen, it resembles the usual double-loop steam or hot-water radiator. At the foot is a gas burner running

Digitized by Google

along the base. Above it is a small boiler filled with a small quantity of water by hand. In a short time after the gas is lighted the water gives off steam which rises through the loops and radiates heat. The supply of gas burning is automatically controlled by the steam pressure on the regulating valve; as the pressure of steam rises the gas is reduced. The burner is fitted with Richmond's "Gas and Air" Adjuster, which ensures perfect combustion, and the gauge-glass indicates the quantity of water in the boiler. Another automatic valve allows the cold air to escape when driven up by the steam. The radiators are especially made to permit a free circulation of air around the loops. The "Monarch" steam radiator has been installed in Kensington Palace, the War Office, Victoria and Albert Museum and many other Government buildings, as well as important theatres, schools, churches and other places, where it has always proved a great success.

LECTURES AT THE BRITISH MUSEUM.

Mr. Banister Fletcher, F.R.I.B.A., gave the introductory lecture of a course of twenty-four University Extension lectures on "Ancient Architecture," at the British Museum on Tuesday afternoon. He first dealt with the nature of the lectures to be given during the coming winter, saying that he would trace the evolution of Ancient Architecture in Egypt, Assyria, Greece, Rome and Byzantium on broad lines from a popular point of view. Architecture was the visible exponent of civilisation embracing the other arts, and all designs at the present day were founded upon old art suited to modern needs. The study of architecture was thus necessary to architects, craftsmen and art students, and further it would be difficult to find anyone to whom a knowledge of it would not be beneficial. The author, journalist, photographer and antiquary required a knowledge of the evolution of the successive periods of architecture in order to enable them to take an intelligent interest in their work. The teaching profession were also endeavouring to make history interesting by referring to the dwellings and temples people constructed to suit their social and political requirements.

A knowledge of architectural history also added much to the enjoyment and benefit of travel which is so popular in these days of quick and easy transit, for it would enable travellers to take an intelligent interest in the buildings and monuments from which the history of the past could be gleaned. By a study of the most beautiful buildings which had been erected in past ages an improvement in the architecture of our own country would assuredly result. The lectures are to be illustrated by some 1,200 views, the object being to transport students as it were to the actual sites, and so familiarise them with the principal buildings, and during the twenty-four hours so spent they would be enabled to study what would require in actual travel at least as many months.

Mr. Fletcher next gave a short illustrated review of Ancient Architecture in order to show the various types of buildings erected during the period.

This course of lectures is the first illustrated by lantern slides given in the British Museum, and should be of special value to the student, as he stands in the midst of the world's richest collection of ancient fragments of art, of which the lectures form an excellent explanation. Indeed, it should make the Museum much more useful and enhance its value to the public which justifies its existence. The trustees are therefore to be heartily congratulated on this new departure.

The lectures are given on Tuesday afternoons at 4.30 in the Assyrian Saloon. The subject of the next lecture will be "Egyptian Architecture," and all particulars can be obtained from Miss Gaudet, Hon. Secretary of the Course, 120 Cheyne Walk, Chelsea, S.W.

At the last meeting of the Council of the Institution of Municipal Engineers, twelve applications for membership and seven for studentship were considered. Of the former nine were accepted, of the latter six. The roll of the Institution now stands at 612 members and eighty-two students, making a total of 694. A design for students' certificates was approved, and the secretary was instructed to put the matter in hand. It was decided that three Council meetings during the present financial year should be held on a Saturday at two o'clock. Notice of the following motion was given:—That the existing classification of members be reconsidered on a wider basis.

THE STATUS OF THE ENGINEERING PROFESSION.

Mr. G. Allan Thomas, the winner of the "Status" prize, awarded by the Society of Engineers for the best essay on "How to Improve the Status of Engineers," read his paper on Monday at a gathering of members of the Society at the Caxton Hall. Mr. Edward John Silcock, the president, was in the chair.

In depicting the difficulties which the professional engineer has to contend with, the author remarked that although the science of engineering enters very largely into modern civilisation, the position of engineers at the present day is far from satisfactory, and will not improve until definite steps are taken to secure for them that recognition which is accorded to members of other professions. The term "engineer" is too loosely applied, and is often used by those who have no proper claim to be so described. Every branch of the profession, civil, mechanical and electrical, is equally concerned, and they should unite to overcome the obstacles by which they are handicapped; some of these difficulties being stated as follows:—

Overcrowding of the Profession.—This is due to the constant influx of men lacking sufficient scientific training, who have no great love for their work, but are apparently tempted by the ease with which a footing may be gained.

Misuse of the term Engineer.—This word is seen tacked on to almost every industry, and unfortunately it has gone on for so long that the only remedy will be to find a new word with which to designate members of the profession, unless means can be devised for restraining the use of the old title by unauthorised persons.

Multiplication of Societies.—The tendency of the present day is all towards an increase in the number of engineering societies, but although such associations do good work, it is a mistaken policy to allow members to use the initials of societies other than the three principal institutions as a distinguishing mark.

Advertisement.—Engineering businesses cannot refrain from advertising, but no professional man should be allowed to do so, whether he be a consulting engineer or the manager of a business concern.

General.—In the absence of any legal status, it is difficult to establish a scale of fees, and so to prevent cutting of prices. Consultants are also unfairly hampered by manufacturers, who give advice, naturally biassed, on engineering matters, and prepare estimates and drawings free of charge, in order to secure work for the firms with which they are connected.

Having sketched the chief hindrances to the advancement of the profession, the author proceeded to outline a scheme for their removal. In the first place, he advocates the election of a "Central Organising Body" from members of the three most important institutions, those of the Civil, Mechanical and Electrical Engineers respectively. Such a body should be equally representative of each institution, and for this purpose each should be placed on the same footing, since as far as the scientific training of their members is concerned there is no material difference. The "Central Body," when complete, should endeavour to obtain recognition as a legalised corporation by Act of Parliament, and should have supreme organising and judicial powers in all matters relating to the profession. They should also have power to appoint committees to deal with special subjects. The points to which they should first apply their energies should be (1) Registration; (2) Education; (3) Minimum fees; (4) Organising funds to aid invention and research. An effort should then be made to formulate schemes for the establishment of an information bureau for engineers, and the institution of a benevolent fund.

In conclusion, he remarked that every effort should be made to arouse interest in this important question of reform, because delay will only tend to make the problem more complex.

Messrs. Charles Brand & Son, 188 West Regent Street, Glasgow, have been awarded the contract for the construction of the Imperial Dock, Leith. The work is to include excavation, masonry, timber and cement work. Messrs. Brand were the contractors for the construction of the dock at Grangemouth, completed eighteen months ago, and recently constructed the dock and pier works at Kirkcaldy. The work is expected to cost about 100,000*l*.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

SHORT WEIGHT PAINTERS' BRUSHES.

At the Birmingham Police Court Mr. A. C. Leng, trading as C. H. Leng & Son, brush manufacturers, Reliance Works, Sherbourne Road, Balsall Heath, Birmingham, was recently summoned at the instance of Thomas Marson Till, 8 Old Jewry, London, secretary of the British Brush Manufacturers' Association, for selling brushes to which a certain false description was applied, the brushes being marked "9 ozs.," but in fact contained a smaller weight of bristles. The charge was admitted.

Mr. Joy, who appeared for the prosecution, said it was taken out under the provisions of Section 2, paragraph D of the Merchandise Marks Act, for applying false trade descriptions to certain goods. It had been instituted by the British Brushmakers' Association to protect not only the public but also the trade from mistakes of the kind that appear to have been made in this case. The particular charge is that seven brushes of this description, which are marked so that everyone can see that they contained nine ounces of bristles —bristles which are of considerable expense—were dissected and taken to the Corporation Department to be weighed with absolute accuracy; instead of weighing nine ounces they weighed a shade over eight ounces. That might seem a trifling matter, but when one-ninth is left out it meant a very considerable amount to that person, to the loss of the purchaser. The regular practice in the trade, for the purpose of safeguard, was to weigh out to the man the full nine ounces of these bristles. So far from there being any loss worth speaking of, except on taking them to pieces, there would be a slight increase, because of the seccotine or cement which they fix them in with. These have been weighed with extreme care, and taking into account the handling of the brushes, the result is they are practically an ounce short. As the defendant pleads guilty, said the prosecution, there was no more to say, except on behalf of the Association undertaking the prosecution. Their object would be achieved if the attention of the trade was brought to the fact that this kind of thing cannot be permitted. The defendant should pay such a sum as costs as would reasonably save the Association from being out of pocket in the matter. The brushes weighed eight grains over the eight ounces, and there are about 437 grains to the ounce.

On behalf of the defendants it was explained they were members of the Association which instituted the prosecution. That they had committed an offence there was no doubt, but it was a technical offence under the Act. It was a custom in the trade, admittedly a bad custom, but nevertheless a custom to mark out eight ounces exactly and manufacture them under weight. Several specimens of brushes made by other manufacturers had been weighed, and all were under weight. The Act says that if a manufacturer puts "nine ounces" on a brush he has to put in nine ounces. It is a common expression in the trade that a nine-ounce brush does not contain nine ounces. The Association wanted to stop it. It was merely a test case, and the first of the kind in this particular trade. As the defendant had done no more than his fellow manufacturers had done, it was submitted the technical offence should be dealt with accordingly. The prosecution were given every possible assistance. The offence was at once admitted. The action was simply to warn the trade that such a thing is not legal and not in the best interests of the trade, and the case would be met by a nominal penalty and as much mercy as possible so far as costs are concerned.

In reply to the prosecution, exception was taken to the assertion this was the proper custom in the trade.

The Chairman of Magistrates said, that as this was the first case of the kind brought before the court, he thought that justice would be met by inflicting a small fine of 1*l.* and three guineas costs.

This was agreed to, and the other summonses were withdrawn.

The Tiverton Town Council, who are threatened with an action on account of the nuisance caused by their sewage works, have under consideration an independent report in which improvements at a cost of 9,000*l.* are advised.

The Willenhall Urban District Council have adopted a scheme, prepared by the surveyor (Mr. T. Edgar Fellows), for new sewage disposal works. It was resolved that the scheme, plans, estimate and specifications be approved, and application made to the Local Government Board for sanction to borrow 12,000*l.* for the carrying out of the works.

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*editions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXÉCUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM. By HENRY BEYEART, Architect. This work contains the most interesting productions of Henry Beyeart, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work consists of 240 folio plates, in two portfolios. Price complete, £14.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a Supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

NEWMAN'S PATENT REGULATING HELICAL SPRING HINGES.
WITH PATENT STOP TO PREVENT OVERWINDING.
The power can be instantly taken off while the Hinges are being fixed and afterwards adjusted to close the door conveniently. They cannot be overwound.
Made in Brass and Iron, 3, 3½, 4, 4½, 5, 6, and 7 inches.

NEWMAN'S NORTON SYSTEM.
MADE IN MALLEABLE IRON.
The Best Door Spring and Check for closing doors without noise.
Pressure is direct, but diminishes pleasantly as door is opened.
Also made with Patent Regulator to latch stubborn bolts.

NEWMAN'S PATENT INVINCIBLE,
WITH AND WITHOUT PNEUMATIC CHECK.
Will hold door *rigidly to centre*, but diminishes in power as door is opened, allowing comfortable passage through.
The *Best* Spring to close door *against wind pressure*, and the most suitable for Banks, Schools, and other public buildings. Made in sizes to suit all doors.

Made solely by W. NEWMAN & SONS,
DOOR SPRING MAKERS AND BRASSFOUNDERS,
Established over 100 Years. HOSPITAL ST., BIRMINGHAM.

TRADE NOTES.

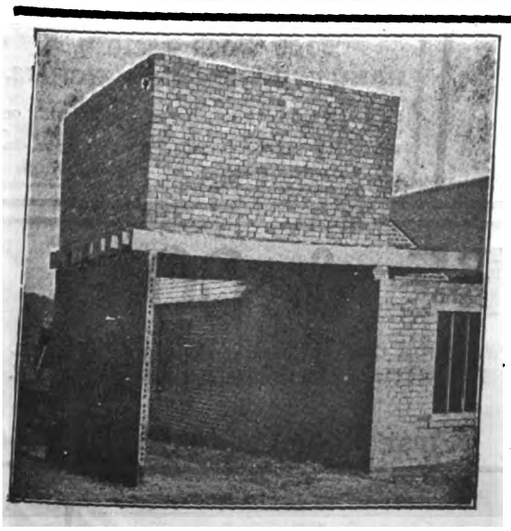
The Expanded Metal Co., Ltd., inform us that they have appointed Mr. B. J. Miller, one of their works' representatives, to succeed the late Mr. Harry Mason as their representative in Manchester and district. The company's Manchester address has been changed to Temple Chambers, 33 Brazenose Street, Manchester.

Under the direction of Mr. W. J. Smith, architect, Market Harborough, the "Boyle" system of natural ventilation, embracing the latest patent "air-pump" ventilators and air inlets, has been applied to the Rothwell Congregational Church.

Messrs. Wm. Potts & Sons, Ltd., Leeds and Newcastle, have received instructions to make and fix a new illuminated quarter chime clock at Holme Bridge Parish Church, near Huddersfield. The new clock and chimes made by Messrs. Potts for St. Cuthbert's Collegiate Church, Darlington, will be dedicated on Sunday next. Messrs. Potts have also another large clock and chimes in the latter district for the South Bank Catholic Church, Middlesbrough.

Mr. Thomas Athey, formerly connected with Messrs. Spencer, Santo & Co., the old-established building contractors, of Warwick Road, Kensington, has joined the staff of the British Uralite Company, of 16 St. Helen's Place, E.C. Mr. Athey's extensive practical experience of all matters appertaining to building operations will be at the service of the Company's clients in estimating for the erection of buildings constructed of its various well-known fire-proof materials. The company has an extensive connection with various Government departments, and with most municipal bodies, which it is believed the foregoing arrangement will tend to extend.

Two leaflets have come to us from Kynoch, Ltd., Birmingham; the one deals with their patent roller bearings, and the other with their self-oiling bearings. The Kynoch roller bearing was introduced twelve years ago, and has been since improved until its co-efficient of friction of repose and motion is about one-tenth that of an ordinary bearing. It is calculated that by carrying the main and counter shafting on their patent bearings a saving of from 50 to 75 per cent. of the power used to drive the shafting will be effected. The Kynoch self-oiling bearing is so successful that one charge of suitable oil will last a year; this is due to the fact that there is absolutely no leakage, and the bearing is dust proof. Kynoch, Ltd., especially advocate their employment abroad. Both these patents are of great importance to the machinery user.



The Ratner Safe Company boast a record that no Ratner improved fire-resisting safe has ever had its contents destroyed by fire, and no Ratner thief-resisting safe has ever been opened by burglars. Their invulnerability to fire has been demonstrated in many conflagrations, one recent occasion being the fire in August last in Ingram Street, Glasgow, when damage was done to the value of 250,000*l*. A safe belonging to Messrs. T. McBride & Logie passed through the ordeal so successfully that although the safe was hot for four days its contents remain undamaged. An even severer test was carried out a few months ago in Bloemfontein to show that Ratner safes were capable of complete fire-resistance under worse conditions than those occurring at a fire in the local Government buildings, when the contents of several safes were irretrievably ruined. The official firemaster placed a List 2 fire-resisting safe No. 4½ on a wooden framework; between the framework and underneath the safe was placed 200 lb. of coal and small blocks of timber heavily coated with tar. A 5-foot brick wall was built around it, allowing a space of 12 inches all round between the safe and the wall. In this space another 200 lb. of coal was packed, also heavy timbers coated with tar and sprinkled wih 5 gallons of paraffin. On the top was placed heavy lumps of coal right round. Further quantities of tar and paraffin were finally sprinkled over the top. The fire lasted nearly four hours. On the following day the safe was opened with a key without difficulty in the presence of Government officials. The contents (including a thermometer, a box of matches, books, tissue, grease and art paper) were perfect, the only exception being some paraffin wax, which had melted. The test was a revelation to most of the spectators as to the capabilities of modern fire-resisting safes.

BUILDING AND BUILDERS.

The Gillingham Town Council last week passed plans for seventeen houses and two shops.

The Cheshire education committee have decided on the enlargement of the Agricultural and Horticultural College at Holmes Chapel, at a cost not exceeding 6,000*l.*

At the last Weybridge Council meeting it was reported that plans had been submitted by Mr. W. G. Tarrant for the development of Brooklands estate.

The Epsom Urban Council are having plans prepared for a sludge disposal scheme estimated to cost 4,030*l.* Tenders will shortly be invited. A proposal that the surveyor's department should be allowed to tender has been rejected.

The Huddersfield Board of Guardians on Monday considered three schemes for the erection of a tuberculosis sanatorium on Honley Moor, and decided in favour of building a home for twenty patients at a cost of 4,000*l.*

The *Liverpool Courier* on Tuesday announced that the Midland Railway Company, who had passed a scheme for the rebuilding of the Adelphi Hotel, Liverpool, at an estimated cost of over 600,000*l.*, have, owing to the Budget proposals, indefinitely postponed the project.

Messrs. L. & C. Hardtmuth are about to erect new premises in Kingsway, to be known as "Koh-i-noor House." The designs have been prepared by Mr. J. S. Gibson, of 5 Old Bond Street, and the builder is Mr. Jas. Carmichael, of Wandsworth.

At the Coatbridge Dean of Guild Court lining was granted last week to the Wilson and Union Tube Company to make extensions at their works at a cost of between 3,500*l.* and 4,000*l.* This erection will be 465 feet by 130 feet. Messrs. Stewarts & Lloyds were granted lining to erect an electric supply branch at the British Tubeworks. An application by the Waverley Iron and Steel Company for lining to erect a laboratory at their works was continued sine die.

The Old Kilpatrick School Board, N.B., have under consideration the question of a new higher grade school for Clydebank. Last week the master of works submitted a new plan showing a two-storey building, and costing about 17,000*l.* Before coming to a final decision it was resolved to visit higher grade schools in other places. The master of works also submitted plans of a new board room, &c., but it was agreed to leave over their adoption in the meantime.

The Edinburgh Dean of Guild Court has granted a warrant to the Commissioners of Works for the addition of another storey and alterations to the Central Post Office in Edinburgh. At the same meeting on the 7th inst. the Court had before it a petition from the Commissioners for a warrant for the erection of laboratories at the Royal Botanic Gardens. Dean of Guild Wilson said the Court would like the front kept 30 feet back from the centre of Inverleith Row. The plans showed 25 feet. He also expressed some doubts as to the drains, the fall being slight. It was agreed to continue the application.

The Devon County Council at their last meeting accepted the following tenders for works at their schools:—Beaford Council school, alterations and repairs, Messrs. Ridge & Shute, 80*l.* 10*s.*; Kenton Mixed Council school, new drainage, &c., Messrs. Page Bros., 72*l.* 10*s.*; Littleham and Landcross Council school, alterations and repairs and new house for teacher, Mr. A. Darch, 777*l.* 4*s.* 4*d.*; Shebbear Council school, repairs, Mr. H. Grant, 41*l.* 10*s.*; Ugborough Council school, alterations, Mr. F. J. Badcock, 65*l.* 14*s.*; Westleigh Council school, new boundary wall, Messrs. Ridge & Shute, 38*l.*; Werrington Council school, covered shed, Messrs. R. Adams & R. Soper, 31*l.*

At the last meeting of the buildings committee for the First or Upper District Committee of the County of Renfrew, it was intimated that plans for new buildings had been lodged of which the total value was 68,710*l.* In the corresponding period of last year the value was 10,740*l.* Among the plans were the following:—Nine flatted cottages and four shops at the corner of Crow Road and Whittingehame Drive, Jordanhill, for W. M. Whyte, 87 Union Street, Glasgow; four tenements in Newlands Road, Cathcart, for Robert Jackson, 121 Alexandra Parade, Glasgow; two tenements at Clarkston Toll, Clarkston, for the trustees of the late Robert Burns Ure; five tenements in Holmlea Road and new street to the north of Holmlea School, Cathcart, for Messrs. George Eadie & Sons, 405 Mathieson Street, Glasgow; double cottage in Slaymanhill Road (road to Overlee), Clarkston, for James Merry, 106 Smith Street, Govanhill; terrace of ten cottages and a double villa in a

proposed new street off Carmunock Road, King's Park, Cathcart, for Messrs. John Dickie & Son, King's Park Road, Mount Florida; two double villas in Busby Road, Giffnock, for John Allan, 60 Reidvale Street, Glasgow; terrace of twelve cottages in new street off Busby Road, Giffnock, for James M'Luskey, 131 Hospital Street, Glasgow; double villa at Mansewood for A. M'Lellan, builder, Pollokshaws; tram car depôt at Newlandsfield for the Glasgow Corporation Tramway Department; terrace of fourteen cottages in Selbourne Road, Jordanhill, for Messrs. William Downs & Sons, Glasgow Road, Uddingston; one two-storey tenement off Polnoon Street, Eaglesham, for James Brown, 697 Duke Street, Glasgow.

VARIETIES.

The first of a series of five lectures on "Sanitary Building Construction" was given by Mr. H. D. Searles-Wood, F.R.I.B.A., at Carpenters' Hall, London Wall, on Thursday evening.

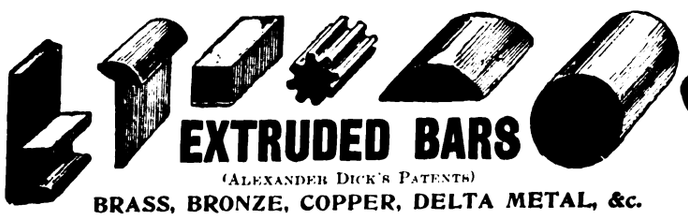
Mr. N. F. Spence, sanitary inspector and surveyor to the Leake Rural District Council, has been selected out of 143 candidates for the same post to the Hartshorne and Seals Rural Council.

The Leith Town Council, N.B., have appointed a committee to inquire into the advisability of erecting a public hall with or without a public library on ground belonging to the Corporation at Leith Walk.

The Yeovil Town Council have received a letter from the Local Government Board granting the application of the Yeovil Town Council for powers to borrow 27,500*l.* for the purpose of reconstructing the sewerage and sewage works of the borough.

The Rugeley Urban District Council last week passed the following plans:—A new house in Fortescue Lane for Mr. F. Upton; two villas, Market Street, for Mr. F. Hill; and a Jubilee Hall and Institute for the Foresters' Society in Anson Street.

The city engineer of Sheffield has been instructed to prepare plans, specifications, estimates and quantities, in respect of a bridge to be constructed over the river Sheaf, in connection with the proposed new street from Waingate to Furnival Road.



It has been reported to the Leeds City Council that the work done by unemployed men in connection with the Corporation afforestation scheme was far from satisfactory, and that 40 per cent. of the trees planted had been lost. It was estimated that the value of the work of these unskilled men was not more than one-sixth of that of skilled planters.

The foundation stone of Christ Church Congregational Church, New Southgate, N., was laid on the 9th inst. The design is in late Gothic. Bath stone is being used for the dressings, pressed red bricks for the facings, pitchpine for the joinery. The contract is let for 4,597*l.* to Mr. Jas. W. Jerram, Crown Works, East Ham, E.; the architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, W.C.

The South Shields electrical committee recommend application for a loan of 8,500*l.* for the purpose of extending the station plant. The engineer estimates the cost as follows:—Engine and generator, 5,700*l.*; pipe work, 450*l.*; buildings and foundations, 950*l.*; circulating pump and tank complete, 700*l.*; crane, 300*l.*; and contingencies, 400*l.*

The burgh surveyor of Perth has submitted to the city hall committee of the Town Council a sketch plan of the proposed Session House. The committee have also considered proposals by the City Chamberlain, on behalf of the East Parish Church Session, with reference to the erection of a hall for the church in conjunction with the new Session House. It has been resolved to leave it to the Kirk Session of the East Church to negotiate with an adjoining proprietor for the acquisition of additional ground for the erection of the new Session House and proposed hall, and to report to the committee.

Mr. W. G. Lovell, of Bedford, and late of the Newport Pagnel Brewery Co., Ltd., who died on July 13 last, left estate of the gross value of 41,889*l.* 9*s.* Of this amount he left about 35,000*l.* upon trust for the erection and endowment of "Sydney Howard Lovell" almshouses. The almshouses are to be built so as to be free from draughts, in red brick, with red tiled roofs, and concrete under wooden flooring, and, if possible, on a site to the east of the schools at Oakley. Each house is to have a small garden in front,

suitably planted with rose trees, and one at the back partly planted with fruit trees. The occupants are to be either married couples or single persons. The married couples are to receive 10*s.* per week, and single persons 7*s.* 6*d.* per week.

MEASURES BROTHERS, LTD.

The Board of Trade on Monday issued a long report dealing with their enquiry into the affairs of Messrs. Measures Bros., iron merchants, London. The investigation was at the instigation of a shareholders' committee, appointed on the requisition of upwards of 500 shareholders in various parts of the country, representing £200,000 capital. Measures Brothers, Ltd., was founded in 1870 by Mr. Robert H. Measures and his brother, Mr. Richard Isaac Measures, who died a few years ago. In 1899 it was formed into a public limited liability company, with a share capital of £285,000, the goodwill standing at £203,581.

Last year a committee of the shareholders was appointed to investigate into the condition of the company, and in consequence of their report a Board of Trade inquiry was demanded. This was opened in June last by Mr. Archibald Read. His report, just published, deals in detail with the many matters in the company's history which provoked the action of the shareholders' committee. The committee's persistent endeavours have been justified, for a *prima facie* case alleged in their affidavit is said by Mr. Read to have been sustained by the investigation. Their allegation was to the effect that the stock certificates and balance-sheets of the company for 1904, 1905, and 1906 had been falsified, but the report is careful to point out the case made out is *prima facie*, and that it would be unfair, after an inquiry conducted on these lines, to express a final opinion. "To do so," says Mr. Read, "would be unfair to Mr. R. H. Measures, who has not had, in an inquiry conducted on these lines, the advantage of presenting his case and calling and examining and cross-examining witnesses by counsel as at a regular trial, and in whose favour a great many points might be urged, and possibly many witnesses called, particularly late auditors, who might throw a different light on the case."

NEW CATALOGUES.

The Türk system for the hygienic drying of new buildings and damp walls has been steadily growing in general favour. The *modus operandi* has been already explained in these columns, and moreover its general use makes another description unnecessary. But with the approach of the winter season it may not be superfluous to again comment on the facilities that the Türk system offers for the speedy drying of new buildings. For testimony of its efficacy no one can want a more convincing proof than that the German Government employed the system in March last after the River Elbe had broken its banks and flooded about fifty-nine villages and 160,000 acres. The process of drying this immense area was completed in less than four weeks. It may be here mentioned that a freshly plastered room is perfectly dried in one to three days. On the Continent architects nearly always include the drying in the quantities. English architects would be well advised to follow this practice when, as usually happens, the buildings are wanted for immediate use. This escapes the addition of another extra to the building owner's bill. If artificial drying is not required, the amount is saved. The Türk system has been extensively used in this country for large and small house-property, shops and business premises generally; but there appears to be one class of building where it has not yet gained a firm footing, viz., in schools. This is surprising, for such structures would seem to offer a splendid field for its successful employment by the authorities. A special feature has been made of drying strong rooms. Several of the larger towns have agents to whom licences have been granted by Messrs. Setzer & Co., 16 Tariff Street, Manchester.

The General Electric Company, Ltd., have prepared an illustrated pamphlet to indicate some buildings in which the "Osram" lamp has been introduced, such as the Law Courts, the Guildhall, Savoy and Metropole hotels in London, as well as factories, steamships, and railway trains. It is claimed that the Osram lamps are made to burn in any position, and in different shapes and sizes. They will yield the same light at about one-fourth the cost of current incurred with carbon filament lamps, or at approximately

RUBEROID GREEN ROOFING

Ruberoid is a high-grade permanent roofing, suitable for all buildings and all roofs. Is made in three colours, GREEN, RED and GREY. The colour is not a painted coat, it is incorporated into the surface of the material during actual process of Manufacture.

two-thirds the cost of current used by lamps whose filaments are composed of tantalum metal. The cost is put at twenty hours for one penny. Their average life is 2,000 hours. It is important to mention that no alteration is required to the installation previous to removing the old and wasteful type

of lamp and replacing it with an Osram. Mr. Hassall has designed a large coloured poster for the company, showing a delighted working man and his family sitting at a table brilliantly illuminated by a single "Osram."

The interim catalogue "E" issued by Twyfords, Ltd., is intended as a herald to a larger supplementary catalogue which will shortly be issued. Half of the forty pages are devoted to pedestal lavatories and lavatory basins. The remaining twenty illustrate w.c. basins, urinals, fountain hand basins, and pedestal ccommodes. There are some new designs in the pedestal lavatories. These are modelled with a view to hygienic considerations, and like all the other basins, have roll edges which replace the dirt-collecting sharp edge of yesterday, and in addition reduce the danger of chippings: at the same time they improve the appearance. In any up-to-date sanitary appliance rounded edges and plain surfaces must be substituted for mouldings and angles. Messrs. Twyford have done this, though at the same time they have been able to retain some of their old patterns. All the goods in this small catalogue are made in their fine white "C V" ware, which is guaranteed to be non-crazing, and which is recommended for durability, evenness of surface and purity of colour. Messrs. Twyfords say, "The introduction of new manufacturing processes enables us to make many reductions in price; in numerous instances to a considerable extent."

The following plans were approved by corporate committees of Bolton during September:—Mr. James Arrowsmith, eight houses in Rainshaw Street; and Mr. Geo. Sykes, five houses and shops in Old Road, Astley Bridge. Messrs. Leigh Bros., seven houses in Alexandra Road, Tonge. Messrs. W. & C. Ainsworth, for dynamo house in Weston Street; and Messrs. J. Harwood & Son, for addition to mill in Rishton Lane, Great Lever. Mr. Levinus Taylor, for shops in Chorley Old Road; and Messrs. Leigh Bros. for eight houses in Malvern Avenue, Smithills. Messrs. J. Marsden & Sons, Ltd., for new roof over boiler-house at No. 2 mill in Fletcher Street; the Hippodrome, Ltd., for stores in Back Queen Street; Dr. J. Wood, extension to boundary base in Derby Street; Trustees of Queen Street Mission, for new shed at Canal Wharf; Messrs. Makin Bros., for eighteen houses in Penarth Road; Mr. William Makant, for smithy at Gilnow Bleachworks; Messrs. Wolfenden & Sons, for mill extension in Marsh Fold Lane; and Messrs. A. Bromley & Co., Ltd., for extension at Folds Mill, Folds Road.

THE PRESENT POSITION OF THE SEWAGE DISPOSAL QUESTION.*

The issue of the Fifth Report of the Royal Commission on the treatment of sewage may be considered as a sign-post to mark the progress of the science and practice of sewage treatment. Of necessity such reports cannot be quite up to date, as the time required for their compilation and printing, &c., permits the march of progress to outstrip the labours of the workers and writers, whose published observations cannot keep pace with events, and it is not surprising, therefore, to find that even at the moment of issue the official report is "out of date." Perhaps nothing will illustrate this point better than the reference in the Fifth Report to the slate beds for the primary treatment of crude sewage. On page 67 of that report, dated August 7, 1908, these beds are referred to "more as preliminary settling or septic tanks than as contact beds," and the commission was unable to express an opinion as to the amount of digestion of sludge which takes place in them. As the beds had been at work for over three years, following eighteen months' preliminary trials, it is evident that the vast labours undertaken by the commission had not left them time to keep up to date, which is shown by the fact that in the following April, at the request of the Irish Local Government Board, the commissioners did make an investigation of these beds, and in contradistinction to the above observation as to the comparison with "settling or septic tanks," which, as everyone knows, produce most objectionable odours and foul-smelling sludge, Mr. Carter, one of the commissioners' chemists, reporting on the Devizes beds, referred, in his letter dated April 17, 1909, to the escaping humus as follows:—

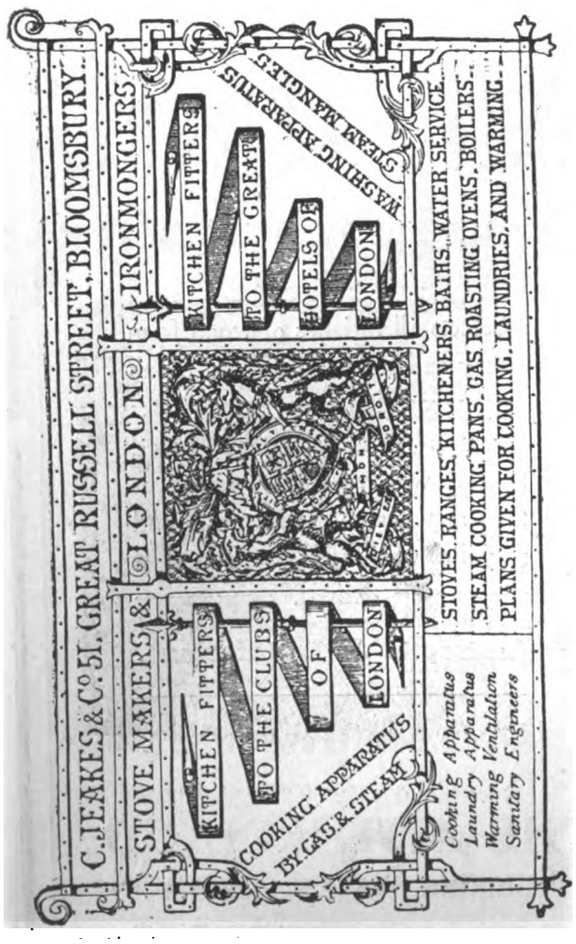
"The muddy liquid is black in colour, and possesses a strong seaweed, but not offensive, odour."

"This sludge causes no nuisance during the process of drying, and when dry breaks up easily into a substance very like ordinary soil.

"On one occasion a bed was opened at the side down to the bottom for the purpose of examining the deposit on the slates. The deposit averaged about ½ inch; it was black and full of small red worms."

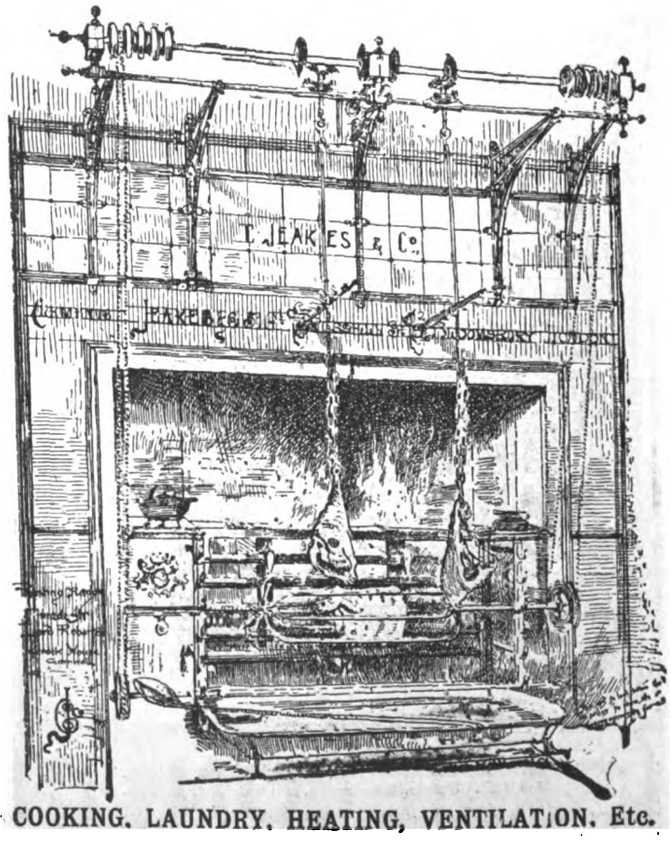
"No offensive odour could be detected in the bed, even when standing at the bottom of it on a hot day; in fact, it smelt exactly like a damp cellar."

These observations are distinctly different from the terms of the Fifth Report, and prove the absolute and entire reverse of the "settling or septic tanks" statement.



There are two points in the above statement which may be referred to—viz. (1) the use of the word "sludge," and (2) the average depths of the deposit on the slates was only "about ½ inch."

In the first it is to be noted that the word "sludge" in connection with sewage commonly denotes a foul-smelling, tenacious slurry, which will not dry readily, but ferments and produces a stench of far-reaching character, and it is this foul accumulation of abomination which is understood by the use of the word; and, moreover, it is the filthy character of the mass which causes all the difficulty in connection with sludge disposal, as no engineer would admit for a moment that he would have a difficulty in disposing of so many tons of "ordinary soil" which possesses no offensive odour. It is for this reason I have used the word "humus" instead of "sludge" to describe the worked-out residue which escapes from the slate beds when once the proper biological condition has been attained. A large proportion of this matter is formed of worm casts, indigestible *débris* and fine earthy matter, which "possesses a strong seaweed, but not offensive, odour." It is therefore clear that, on the showing of the most recent researches of the Royal Commission, the use of the word "sludge" in this connection is entirely wrong and misleading. In this connection the question may be asked:—"If we have 1 lb. of sewage organic solids and convert this into 1 lb. of living worms, &c., plus inert residue, have we purified those solids?"



On the second point, as to the average depth of the deposit on the slates being only about "½ inch." The slates are laid about 2 inches apart. When examined by the Royal Commission they had been in constant use for over three and a half years, in which time the spaces between the slates had been filled up to only 25 per cent., and this fact throws considerable light upon the "amount of digestion of sludge which takes place."

As the whole of the air-dried "humus" or "ordinary soil," which has been produced by this process, was still on

* A paper read on October 6 before the Institute of Sanitary Engineers by Mr. W. J. Dibdin, F.I.C., F.C.S., &c.

C. JEAKES & Co., ENGINEERS, 51, Gt. Russell St., LONDON

COOKING, LAUNDRY, HEATING, VENTILATION, Etc.

Digitized by Google

the works, practically none having been removed, the commissioners could easily ascertain the quantity, and as they are continuing their investigations we shall doubtless have an authoritative statement on this point in due course.

It is therefore perfectly clear on the facts, without calling in the supporting statements of numerous engineers, medical officers of health, chemists, &c., which I have in my possession, that the action of the slate beds is precisely similar to that of "contact beds," the only difference being in the physical arrangement of the supports for the living organisms which are the active agents; and that by their use the sludge difficulty, or in other words, nuisance, is absolutely overcome, without the cost of chemicals, sludge presses, or other expensive machinery.

This result was the point aimed at in the establishment of the slate beds, and was made clear from the first. Certain persons seemed to delight in trying to throw the onus of the cry "no sludge" on to the slate beds, but it is to be hoped that these efforts will cease, and more calm and truthful representations be adhered to for the future. "No offensive sludge" and "no sludge in the ordinary sense" are very different statements to "no sludge," and when read in connection with the accompanying clearly expressed enunciation of the biological process could by no possibility warrant the misrepresentations which have been made in connection with the slate beds.

On the other hand, we have recently had statements made to the effect that the slate beds sludge up.

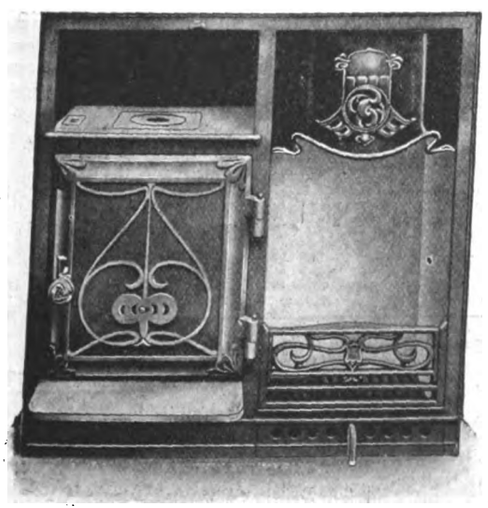
If at Devizes there was an accumulation on the slates equal to only 25 per cent. of the water capacity, which accumulation does not increase, how can it be said that the beds "sludge up"? At other places, such as at Malden and High Wycombe, the time taken to fill the beds with sewage after some years of work is but some 10 per cent. longer than when they were new, which fact alone constitutes a perfect answer to such statements.

But even if in any reasonable time they did sludge up, what then? In the original design it was contemplated that provision must be made for such a contingency, and accordingly flushing shafts are provided at distances about 10 feet apart, and experiments have shown that a very moderate flush of water is sufficient to completely remove the whole of the deposit from the slates, leaving them perfectly clean, with the result that at a trifling cost for pumping effluent through a short length of hose the beds could be rapidly restored to a condition equal to new, as neither the slates nor the tank will be affected by the treatment. It will thus be seen that, whether the slate beds sludge up or not, they are equally permanent and remove the sludge "difficulty" for all time, as the biological process is not one of time, country, nor climate under all ordinary human conditions.

Having thus cleared the ground, necessarily at some length, to remove fallacies and misrepresentations, the details of the system may be more particularly referred to.

As is now well known, the "slate bed" is an improved form of contact bed, which is filled with superposed layers of slate separated at convenient distances, about 1 inch to 3 inches, as may be necessary, apart, by means of slate blocks, the whole thus forming an indestructible series of shelves, on which the sewage suspended matters are deposited when the beds are filled with sewage. As in the case of the old clinker coarse contact bed, the sewage is allowed to remain quiescent for two hours, when the outlet valve is opened and the "primary effluent" run off for further treatment on land, contact or sprinkler beds, &c., as the case may be, or for direct discharge into tidal estuaries, the sea, &c.

This short, condensed description postulates several points, viz.:—



(1) Indestructibility of the slate "shelves." (2) Deposition of sewage suspended matters thereon. (3) Biological action on deposited matters. (4) Action taking place in respect to finely divided matters, colloids, &c., during the two hours' quiescence. (5) Necessity for secondary treatment of effluent. (6) Extent to which such secondary treatment should be carried under varying circumstances.

It will be convenient to deal with these in the order in which they arise:—

(1) *Indestructibility of Slate "Shelves."*—Slates kept wet do not become brittle, as they will when they are allowed to dry. They have lasted for geological periods under enormous pressure, and they may safely be relied upon to answer all human calls upon them for many lifetimes. The only way in which they can be injured in this connection is by improper arrangement of the layers and their supports. As the latter are simply square blocks of solid slate, they have

an enormous strength, and when carefully arranged in columns of mutual support with a heavier layer, say, ½-inch slates, on the top, they will resist any reasonable call upon them. In fact, if necessary, no difficulty would be experienced in making the beds strong enough to carry a roadway.

Again, the beds cannot be destroyed by choking, as already shown, but even if they were intentionally choked they can be flushed clean again very rapidly and restored to a condition equal to new at a mere nominal cost.

(2) *The Deposition of Sewage Suspended Matters.*—This takes place during the period of quiescence, which follows the filling of the beds. Usually this is two hours, but under circumstances—say, to suit the exigencies of tidal flow, &c.—this time may be varied. Experiments made under my direction with the London sewage at Crossness, at the time I was preparing the scheme for the treatment of the London sewage, which scheme has now been at work for some nineteen years, showed that practically absolute deposition of suspended matters in a sewage treated with small quantities of lime and iron took place throughout a depth of 15 feet in forty minutes, the heavier matters settling down very rapidly. These results have been confirmed by many experimentalists since then. As the layers or "shelves" of slate are generally only 2 inches apart, it will be seen that the two hours allowed for quiescent settlement is far more than ample for perfect sedimentation.

Thus the beds in the first instance cannot be better described than in the words of my report to the London County Council, October, 1895, wherein I summarised the results of the work done since the Council gave their authority to the commencement of the work on March 10, 1891, in continuation of the chemical and biological investigations which had been conducted under the Metropolitan Board of Works from 1876, when Captain Calver made his celebrated report to the City of London on the condition of the River Thames, which report resulted in the big "Mud Inquiry," held by the arbitrators, Captain Douglas Galton and F. J. Bramwell, with Sir Charles F. Hartley as umpire, in 1879 and 1880, which was followed in 1882-3-4 by the Royal Commission, presided over by the late Lord Bramwell.

In my report above referred to I wrote as follows:—

"The action of a filter is two-fold: (1) it separates mechanically all gross particles of suspended matter and renders the effluent clear and bright. (2) It effects the oxidation of organic matters, both those in suspension and those in solution, through the agency of living organisms. It is the preliminary establishment and subsequent cultivation of these organisms which is to be aimed at in the scientific process of purification by filtration."

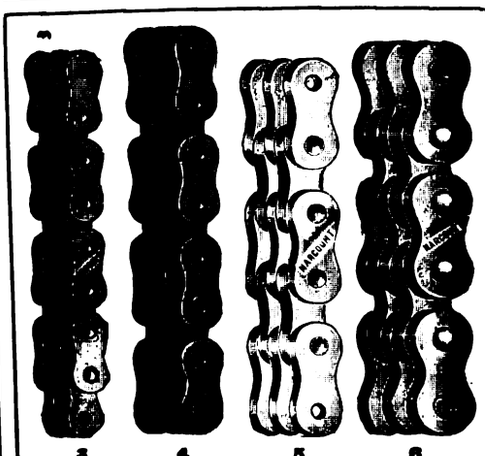
"The ordinary putrefactive and other similar organisms commence the work by breaking down the organic compounds and converting them to less complex forms, principally water, carbonic acid and ammonia; the nitrifying organism then acts upon the ammonia, the nitrogen being converted into nitric acid. For this process to go on, three conditions are essential. Firstly, the organisms must be supplied with plenty of air; secondly, there must be present a base, such as lime, with which the nitric acid can combine. . . .

"Filtration on biological lines of sewage and other foul water containing in solution but little free oxygen and a large quantity of oxidisable organic matter therefore means:—

"(1) That the filter, by cautious increments in the quantity of effluent, which in itself contains the necessary organisms, must be gradually brought to a state of high efficiency.

"This condition will be shown by the existence in the filtrate of a constantly increasing proportion of nitric acid.

"(2) That the contact of the micro-organisms with the effluent to be purified must be effected by leaving such effluent at rest in the filter for a greater or less time according to the degree of purification required, the process being analogous to that of fermentation. The system employed in many places is to run the water straight through the filter and thus allow insufficient time for the work, with the result that the effluent is soon in an unsatisfactory condition.



"(3) That after each quantity of effluent has been dealt with the micro-organisms must be supplied with air, which is readily effected by emptying the filter from below, whereby air is drawn into the interstices. The filter must stand empty for an hour or more previous to another filling."

(*To be concluded.*)

The Petersfield Rural District Council have decided to advertise for a whole-time inspector of nuisances and building surveyor for the rural district, at a salary of 120*l.* a year. The Local Government Board had insisted upon such an appointment being made, as they maintained that the present inspector (Mr. Keates) was unable, with his own private practice, to carry out the duties efficiently.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

Balfour, director of education, County Education Offices, Stafford.

Widnes.—Nov. 13.—For the enlargement and extension of the Widnes Municipal secondary and technical school. Deposit 3*l.* Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

York.—Oct. 27.—For the raising of the archway through the city wall at Leeman Road. Deposit 1*l.* 1*s.* Mr. F. W. Spurr, city engineer, Guildhall, York.

Concrete and Constructional Engineering, in its October issue, devotes a considerable amount of space to the proceedings of the various associations which held their meetings at Copenhagen during September, and which dealt particularly with questions of concrete, reinforced concrete and Portland cement. A most interesting article is published on reinforced concrete in Denmark, illustrating a number of important works executed in that country, and among these illustrations is one showing the launching of reinforced concrete caissons for harbour work in Jutland. Another well illustrated article is devoted to reinforced concrete bridges, chiefly in France. The report of the U.S.A. Joint Committee on Reinforced Concrete also makes interesting reading. As usual, a number of new works in concrete are described and illustrated, as also new applications of that material.

A meeting of municipal engineers held recently at Westminster decided to submit to the War Office and the Board of Agriculture a scheme for the employment of surveyors and municipal engineers in national defence, and a body has been formed to be known as the Municipal Engineers' Imperial Defence Committee. The object of the committee is "the organisation, in connection with the defence of the British Empire, of the members of the municipal engineering and kindred professions and their mechanics and skilled labourers." The committee think that in the event of an invasion a corps of municipal engineers would be of the highest value to the Territorial Force. It is estimated that the strength of the corps would be approximately 2,000 technical officers and 25,000 mechanics and skilled labourers.

TRADE NOTES.

A quantity of ventilators of entirely new design are being fixed on the new General Post Office, King Edward's Buildings, London, made by Kershaw, Brassington & Co. (Arnold W. Kershaw & Co.), Lancaster and Settle.

New quarter chimes have been fitted to the clock of Buckminster parish church, near Grantham. The work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby, who have also lately received an order from Sir William Hartley for a large clock for Colne, Lancashire.

Mr. F. H. Tulloch held an enquiry last week at Birmingham into the application for sanction to borrow 121,217*l.* for the extension of the Council House. The Town Clerk explained that the application was for a second instalment of a total application for permission to borrow 150,000*l.*, the estimated cost of extending the Council House and providing accommodation for an art gallery. The amount was already covered by contracts entered into. They had already entered into a contract for heating and ventilating amounting to 5,878*l.*, and a further contract for the remainder of the building amounting to 128,744*l.* The principal items of the 128,000*l.* were:—Bricklayer, 14,088*l.*; mason, 38,291*l.*; joiner and ironmonger, 18,703*l.*; founder and smith (including steel work, 10,000*l.*), 17,494*l.*; and the plasterer, 16,309*l.*

The foundation stone has been formally laid of the new church of St. Oswin, which is being erected at Brinkburn, Stanhope Road, South Shields. The new church will displace the small corrugated iron erection in Oxford Street. At present three bays of the nave are being built, at a cost of 3,300*l.*, and this will afford accommodation for 300 people. The church in its complete state will accommodate over 600 worshippers, and is planned on the hall type, the whole of the seating being provided in the nave, the north and south aisles only serving as passage ways. Provision is also made for vestries, organ chamber, &c. The building is designed in Late Decorated style of Gothic architecture, and is being faced with "Pelaw" bricks, with stone freely introduced as dressings. Mr. James Young, of Tyne Dock, is the contractor, and Mr. Henry Grieves, A.R.I.B.A., of South Shields, is the architect.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

By Special Appointment

To His Majesty.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the Scagliola can afterwards be fixed round WITHOUT SHOWING JOINT.

Prize Medals, 1851 & 1862.

A DECORATIVE MATERIAL of the RENAISSANCE WHICH HAS STOOD THE TEST OF CENTURIES.

COLUMNS, PILASTERS, WALL-LINING, DADOS, and all forms of INTERNAL DECORATION.

Descriptive Circular on Application.

BUILDING AND BUILDERS.

THE Glasgow Corporation at their last meeting formally approved the draft by-laws prepared under the Glasgow Building Regulations Act, 1900.

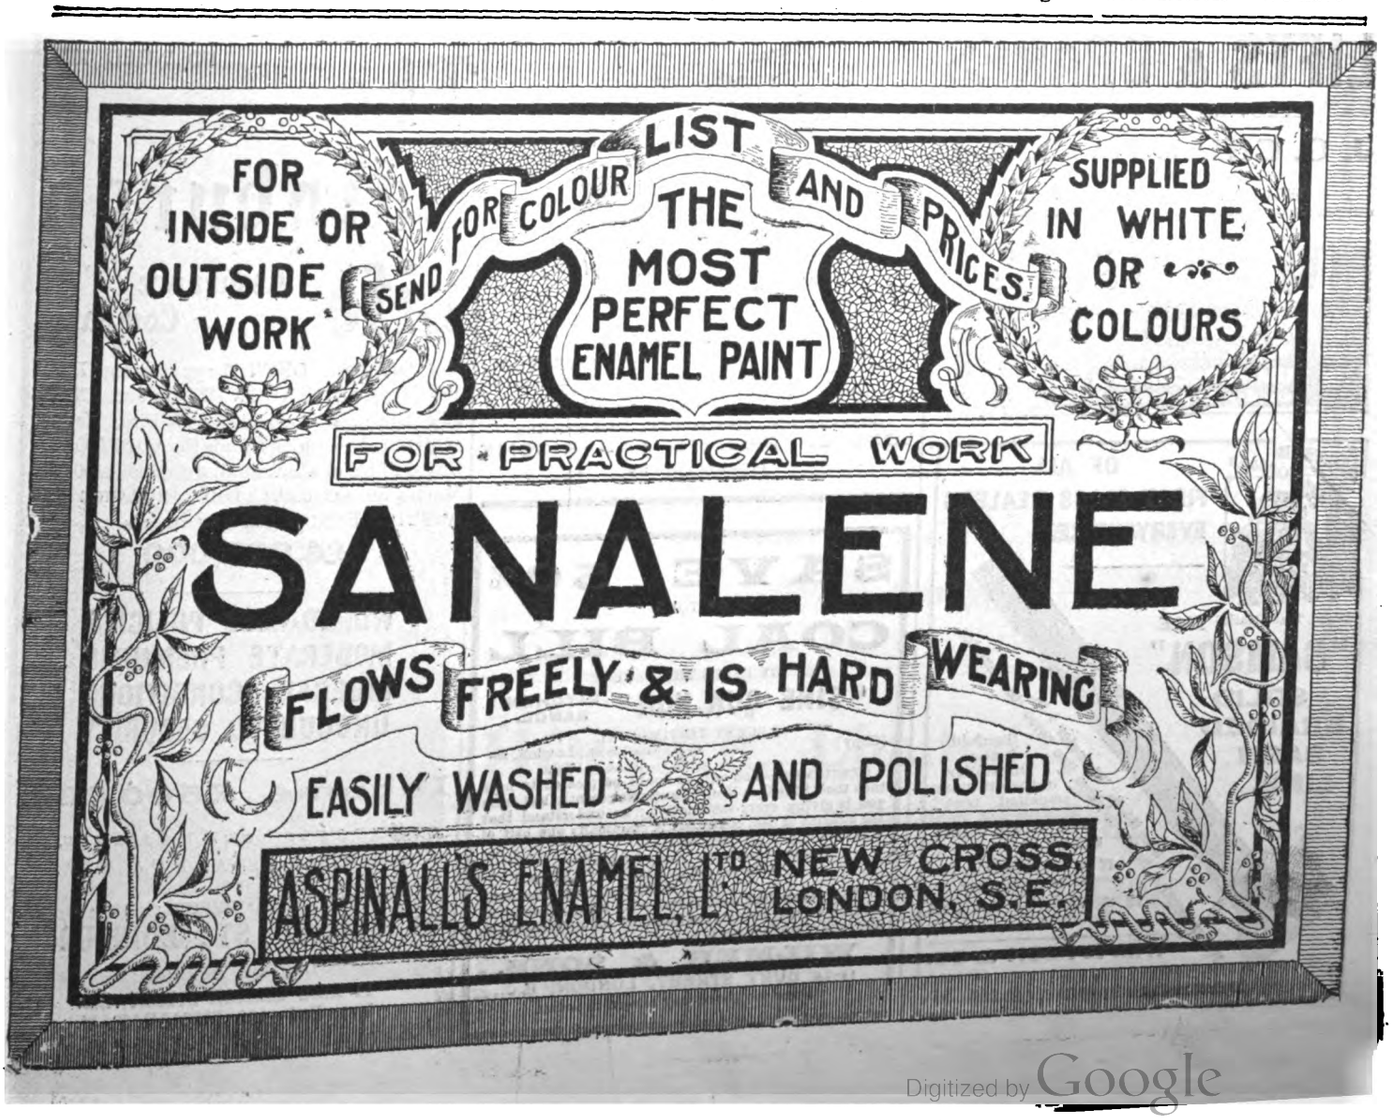
THE Sheffield Master Builders' Association are supporting the candidature of Mr. J. Kaye, builder and contractor, for the Crookesmoor Ward. The Association is not at present represented on the City Council.

AFTER being defeated at the previous meeting, the resolution to obtain the necessary loan of 3,225*l.* for the erection of the dust destructor at Dorking was passed by the Dorking Urban Council last week. The work had already begun.

NEGOTIATIONS are in progress, it is believed, between the Thames Conservancy and the University of Oxford for the purchase by the former of Ray Mill Island, adjoining Boulter's Lock and Cut, with a view to constructing a new lock, lock-keeper's house, lavatory accommodation, &c.

THE Matlock Bath Urban Council have received the consent of the Local Government Board to the erection of a kursaal and pump-room to complete the improvement scheme which is costing the town 50,000*l.* The building will now be commenced on the site by the Fishpond, where about 10,000*l.* will be expended during the winter.

THE Basingstoke borough surveyor has been instructed to report on the advisability of erecting a new dust destructor, as to the site of the present destructor, and also as to the estimated cost, &c. The borough surveyor was instructed to prepare plans, specifications, &c., for making good Coronation Road so far as it is within the borough.



THE Margate Town Council last week adopted the proposal of the works committee for a lower promenade at an estimated cost of 10,895*l.*, but that for widening the upper promenade at the Front was deleted. The Council approved of the plan of obtaining the material for filling in behind the sea wall by excavating a bathing pool on the rocks in front of the promenade at an estimated cost of 11,000*l.*

THE Durham Rural District Council last week passed the following plans:—Stable and coach-house at Auton Stile, for Dr. J. Brown; stable at Ushaw Moor, for Wm. Milburn; house and shop at Blackgate, Coxhoe, for W. E. Robson; alterations to Cross Keys Inn, Sherburn, for W. J. Cameron & Co., Ltd.; new church at Ushaw Moor, for Rev. E. J. Beech; six dwelling-houses at Quarrington Hill, for L. W. Rowe; six dwelling-houses at Auton Stile, for Gabriel Inness.

THE Guildford Board of Guardians have agreed that the men's quarters be so altered as to provide additional accommodation for thirty inmates; that a new house for the master and matron be erected in accordance with a plan submitted to the committee by Mr. E. L. Lunn, and that the central portion of the administrative block be so altered as to provide bathrooms for each sex and bedrooms for the officers. An approximate estimate of the cost of the proposed alterations is 1,800*l.*

AT the last meeting of the Renfrew county buildings committee Mr. T. G. Abercrombie, architect, Paisley, submitted alternative plans for the proposed extension of the County Buildings. One set of plans provided for a building of two storeys to be used wholly as offices, and the other for a building of three storeys to be used as offices and dwelling-houses. Mr. Watson, measurer, estimated the cost of the former building at 5,210*l.*, and the latter at 6,240*l.* It was agreed to proceed with the erection of the three-storey building.

A MEMORIAL signed by about fifty builders and others interested and engaged in the building trades in West London has been issued as a further protest against the Budget. The memorialists state that they "view with great alarm the recent unprecedented increase in unemployment, which is due to the unjust proposals in the present Budget to tax land, which are causing great uncertainty in business transactions, and will result, if the proposals become law, in many old and trusted employés being thrown out of work; and we unanimously condemn and protest against the land clauses of the Finance Bill, which are causing this wide distress We have

Digitized by Google

not purchased any land since the publication of the Finance Bill, nor do we intend to until we feel assured that security of contract will be respected by the Government." A similar announcement has been made by the builders in the North-West of London.

The building committee of the Aston Board of Guardians at their last meeting considered and adopted the report of the sub-committee, who stated that plans and specifications had been submitted by Messrs. Whitwell & Son in respect of the proposed new infirmary and laundry, and by the clerk in respect of the provision of boilers and heating apparatus, received from Messrs. Bernard Hall & Jones, engineers. They recommended, however, that in view of the suggested changes in local Poor-law areas and administration, this work be not proceeded with at present, and that the clerk take charge of the plans. The rough estimates of the proposed works are 69,900*l.* and 6,500*l.* respectively, and as the arrangements with the architects and engineers provided for a payment at the rate of 2½ per cent. upon a reasonable estimate of the cost of the works if for any reason they were not executed, the committee were of opinion that respective payments of over 1,700*l.* and 160*l.* had been earned. They therefore recommended that application be made to the Local Government Board to borrow 2,000*l.* for the purposes of making payments of 1,500*l.* and 125*l.* on account. The committee also recommended that a house be built for the master and matron on the lawn to the south of the workhouse chapel.

The Glasgow Dean of Guild Court on the 14th inst. granted the following linings:—The Steel Co. of Scotland, Ltd., 23 Royal Exchange Square, to erect buildings at Blochairn; the Minard Building Co., to erect tenements and dwelling-houses in Killearn Street, Possilpark; M. Henderson, contractor, Grant Street, to erect buildings at the corner of Great Western Road and Crow Road, and at the corner of Great Western Road and Ancaster Drive; W. Anderson, joiner and builder, 30 King Edward Road, Jordanhill, to erect tenements and dwelling-houses at the corner of Pollokshaws Road and Mannering Road; W. Cochrane, Auchinairn Road, Bishopbriggs, to erect two tenements of dwelling-houses in Ellangowan Road, Shawlands; Springburn Skating Rink Co., to erect a skating rink in Campbell Street; Richmond & Henderson, architects, 116 Hope Street, to erect a double villa in Blairbeth Drive; G. Eadie & Sons, 405 Mathieson Street, to erect four tenements of dwelling-houses in Hollybrook Street; Henry Erskine Gordon, of Aikenhead, Cathcart, to form a street and sewer on the lands of Clincart Mount Florida; the Queen's Park Football Club, Ltd., 216 West George Street, to erect pay entrances and exit gates at Somerville Drive; the Dennistoun Roller Rink Co., to erect a roller-skating rink to the west of Finlay Drive; the General Building Co., 159 Bath Street, to construct a road 40 feet wide beginning at John Street and terminating at Lochburn Road, also to erect four blocks of cottages at Lochburn; John Porter, house factor, 577 Dalmarnock Road, to erect four tenements of shops and dwelling-houses on the north-east side of Dalmarnock Road.

VARIETIES.

A covered shelter is to be erected in Crescent Gardens, Harrogate, by the Town Council at a cost of 1,000*l.*

Surbiton District Council have decided that the special committee shall report on the suggestion of a sewerage scheme for the district. The rejected schemes have cost the ratepayers 2,309*l.*

There are three candidates for the office of Lord Dean of Guild of Edinburgh, viz.:—Mr. J. Macintyre Henry, architect; Mr. W. Allan Carter, C.E.; and Mr. Neil M'Leod, builder.

The twelve mechanical filters at Fairmilehead, installed by the Edinburgh and Leith District Water Trust at a cost of 1,700*l.*, have been formally opened. The system is the patent of Messrs. Bell Bros., Ravensthorpe, Yorkshire.

Messrs. Wm. Watkins & Sons, architects, Lincoln, have been appointed to prepare plans for the proposed Council school in Hungate. The education committee's decision of October 7 to organise a local competition has been accordingly negatived.

Messrs. Alex. Cullen, Lochhead & Brown, architects, Hamilton, N.B., have prepared plans for alterations and additions to the local fever hospital estimated to cost 6,500*l.* Before coming to a final decision the Town Council will obtain a report as to the cost of an entirely new hospital on another site.

The Liverpool City Council have adjourned the consideration of a rehousing scheme submitted by the housing committee, in connection with which it was recommended that the Local Government Board should be asked to sanction a loan of 225,000*l.*

The Maidstone Urban Council have approved the following plans:—Four houses for Messrs. Clarke & Epps; Hastings Road, five houses for Messrs. Clarke & Epps; Union Street, addition to house for Miss Coveney; Tonbridge Road, house for Mr. Frederick Corfe.

The Local Government Board have informed the Weybridge Urban Council that they will not decline to sanction the 5,000*l.* loan for the purchase of the common and heath, if the Charity Commissioners will authorise the sale—a step to which they have already practically committed themselves.

Morecambe Town Council on Monday decided to borrow 12,415*l.* for the erection of a new art and technical school, in conjunction with the Lancashire County Council. The Council approved of the appointment of Mr. William Ryle Wright, London, as consulting engineer for the electrical undertaking for a period of two years, at a fee of 100 guineas per annum, and 3½ per cent. commission on any further capital expenditure needed. The resignation of the borough electrical engineer, Mr. W. H. Hall, was accepted.

The Burslem Town Council last week, after a long debate, decided by a majority of five votes to instruct Messrs. Russell & Cooper, who were awarded first place in the competition, to prepare complete plans and specifications and to obtain tenders for the proposed municipal buildings. The cost was limited to 25,000*l.*, with a 10 per cent. margin and exclusive of architects' fees and sundry other matters. The winning design has been amended since the award was made.

The surveyor to the Holywell Urban Council (Mr. R. A. Thomas) has submitted a report as to the cost of a softening plant and the cost of softening the water of St. Winifride's Well, which it is proposed to utilise for a public supply for Holywell. The total hardness of the water is 18.3 degrees, and from tests made it has been found that it can be reduced to 5 degrees at a cost of about .88 of a penny per 1,000 gallons. The report stated that the water from the well from a purity point of view stands very high.

MESSRS. CHUBB'S NEW FACTORY.

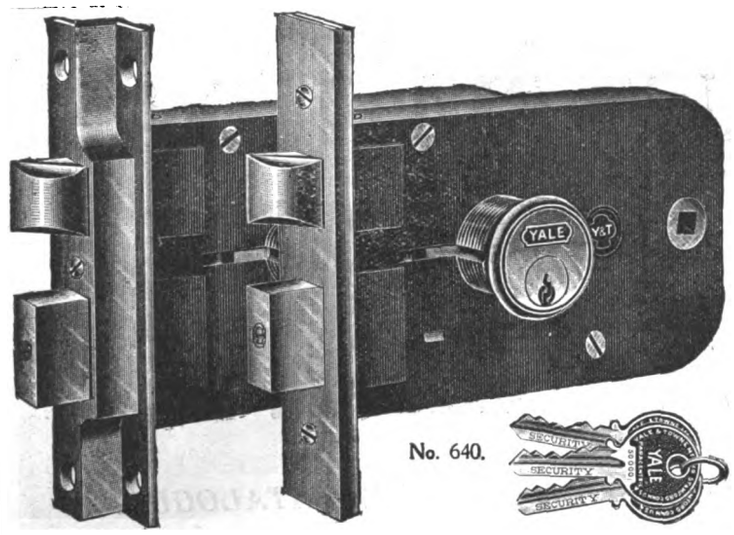
Last year Messrs. Chubb celebrated their ninetieth birthday by Sir George Hayter Chubb, the grandson of the founder, publicly laying the foundation-stone of a new factory at Wolverhampton. Their ninety-first year was marked on the 14th inst. by the Lord Mayor of London formally opening the new works. Of late years the tendency to call attention to cases of individual longevity has made nonagenarians persons of more than local celebrity, more especially if they retain the full possession of their faculties. But in the case of Messrs. Chubb, each additional year seems to bring an increase of vigour and youth, and after ninety have gone by instead of signs of senile decay we see a firm who appear to be barely beginning operations.

About ten years ago Messrs. Chubb were faced with the necessity of extending their factories. In 1901, by way of experiment, they set up a small branch to their London safe-making works alongside their lock works at Wolverhampton. At the same time the relative merits and demerits of other towns were fully gone into. After detailed consideration the decision was arrived at that Wolverhampton was the most suitable, and a freehold plot ten acres in extent was purchased. Among special advantages of Wolverhampton were the railway facilities, the municipal electricity, and the existence of excellent housing accommodation.

Plans for the new buildings were prepared by Mr. G. Gordon Stanham, of Bush Lane, Cannon Street, E.C., with Mr. C. H. M. Mileham as consulting architect. The local superintending architect was Mr. F. T. Beck. The new factory covers a total area of 63,500 square feet. The chief feature is the large erection shop, here illustrated, for the construction of steel strong rooms, treasuries, and safe deposits, which have always been a speciality of Chubb manufacture, this shop being 350 feet long and 40 feet wide, with a height of 33 feet clear of all girders and roof principals. The height of the remainder of the factory is from 16 feet to 14 feet at the lowest part.

Nearly the whole area is undivided by party walls, and the general design of the buildings gives the maximum amount of light, while avoiding as much as possible direct sun rays, and careful consideration has been given to the question of sanitation and ventilation.

Digitized by Google



Electric power is used throughout, and power rooms have been erected and plant therein fitted which will take its electric supply at 5,000 volts from the Corporation mains. This is reduced to 400 volts and distributed amongst thirty motors of various powers from 2½ to 20 h.p., the total providing a nominal horse-power of 200. Electric lighting is also installed.

Many labour-saving devices are introduced, such as travelling cranes and mono-rails. But conspicuous among them are the electric magnets for unloading and handling the steel plates, bars, scrap metal, and similar material without using slings or chains for attaching the material to the crane hook, as supplied by the Witton Kramer Electric Tool and Hoist Co., Birmingham. The crane can lift loads of 1½ tons at a speed of 25 feet per minute, cross traverse with same at 60 to 80 feet per minute, and longitudinal travel the whole length of the building at a speed of 200 feet per minute. The crane bridge consists of a single beam of "I" section R.S.J. The span is 40 feet.

Each motion is driven by a separate electric motor, which is controlled from the cab of the crane. The load can be lifted, traversed, or travelled in either direction by moving a lever handle in the same way as a tramway controller is operated. The magnetic equipment comprises three ironclad lifting magnets, each consisting of a coil of insulated copper-wire contained inside an iron shell; they are attached to a bar suspended from the hook of the crane, and operated by a controller placed with the other controllers in the crane cab.

These magnets lift steel plates, bars, castings, bolts, scrap metal, &c., electrically, it being only necessary to lower them on to the material and operate the switch, when the magnetic force attracts the material and holds it securely until the current is switched off. There is no danger to men working underneath the crane, particularly when, as in the present

The "YALE" Horizontal Mortise Knob Lock.

Manufactured by the Yale & Towne Manufacturing Co., the only makers of genuine "Yale" Locks, whose goods are used and known throughout the world. Established 1868.

Gives the security and convenience of the small "Yale" Key, made in nickel bronze. Possesses unlimited key changes. The latch bolt has "Easy Spring," enabling the door to be closed without noise or slamming or turning the knob. Specification and full particulars forwarded on application.

Digitized by Google

case, the magnets are supplied by a separate dynamo in parallel with an accumulator battery, which, should the dynamo generating the current for the magnets break down or cease to work for any purpose, immediately takes up the load and continues to supply the magnets until the dynamo can again be run. The labour saved by the use of electro lifting magnets is most remarkable.

Hydraulic power is laid on all over the works for use in bending presses, rivetting machines, and for holding down work on other machines. A double furnace for hardening two large plates at once for strong-room work will be provided complete with electric mechanism for registering the temperature so as to insure the plates not being over-heated. Acetylene gas plant is provided for the welding process. The general contract for the buildings was placed in the hands of Messrs. Henry Lovatt, Ltd., of Wolverhampton. The steel construction is by Messrs. Drew Bear, Perks & Co., of London. The electric plant is supplied by the British Westinghouse Co., the consulting electrical engineers being the British Engine, Boiler and Electrical Insurance Co., Ltd., of Manchester.

Messrs. Chubb have retained a large area behind the new factory for the erection of future extensions. To many of the visitors who attended the opening ceremony last week and who were impressed by the size of the latest building, this may have seemed like thinking a little too far ahead. But the firm seem to have the secret of perpetual youth, and the concern, though now a private limited company, is chiefly owned and entirely managed by the Chubb family in conjunction with a board of directors.

The journey both to Wolverhampton and returning to London was by a special train of nine corridor dining cars, L. and N.W. Railway. Luncheon was served on the way down and dinner on the return journey. A number of architects were included in the large party, and were evidently impressed by the proceedings, which were carried out with what might almost be termed military precision. A pleasant little ceremony took place at the Town Hall, when the Lord Mayor of London was welcomed by the Mayor of Wolverhampton and thanked for his visit, and the freedom of the borough was then conferred on Sir George Hayter Chubb, Bart., and on Mr. Alderman Marston, of Wolverhampton.

THE PRESENT POSITION OF THE SEWAGE DISPOSAL QUESTION.*

(Concluded from last week.)

(3) *Biological Action on Deposited Matters.*—As showing the action of the slate beds in effecting the destruction of the solid refuse in sewage the detailed account of some experiments will be of interest.

The destruction of waste organic matters is not due to purely direct physical and chemical causes, but to digestion. On looking at a mass of the deposit on a slate which has been employed for some time in a bed the casual observer would notice nothing but a collection of *débris*. On smelling the mass it is at once realised that it differs from ordinary sludge in that it is inoffensive. On allowing a portion to dry it does so rapidly and without the production of offensive emanations given off by "sludge."

These two facts point to a difference, and invite closer examination. This may be conveniently made as follows:—

Place a portion of the deposit on a small piece of slate, about 3 inches or 4 inches square for convenience, or other suitable support, and warm it very gently by applying heat to the under surface. A considerable movement will soon be seen to take place on the immediate surface, and gradually a heaving mass of minute worms will struggle to escape from the heated underlayer. These are clearly aërobic organisms whose power of digestion is considerable, and it is to a great extent their casts which form the inoffensive humus which escapes from the slate layers with the effluent, thereby preventing the accumulation which is the cause of the choking of the old coarse contact beds.

Next, take a fragment from the surface of the deposit by touching it with the point of a wire and place it on a microscope glass slide with a droplet of water, covering the whole with a thin glass cover in the usual manner. Now examine this with a ¼-inch or higher power. It will be at once seen to be largely made up of innumerable living organisms of great complexity and variety, other than the worms.

From these simple examinations it will be evident that, instead of an inert mass of matter, we have a hive of active and voracious living organisms, from the lowest type of

bacteria up to the highly organised worms, larvæ, &c., which, like a collection of animals in a zoological gardens, feed upon the daily supply of food given to them, and so long as this supply is steadily and regularly maintained, so long will they perform their life functions, and in so doing destroy the waste organic matters which, in their collective form, we call sludge; the process involved being merely that of digestion—the waste products of one group being but food for a lower.

The process may very conveniently be watched from day to day by placing the previously mentioned small pieces of slate in an ordinary plate or saucer, and putting on the "living earth" on the slate small fragments of meat, bread, &c., and flooding the plate with water gently so as to completely cover the whole. After an hour or two gently decant the water from the slate so as to thoroughly drain the slate and deposit thereon. Leave it freely exposed to the air, preferably in a moderately warm atmosphere. On watching from time to time it will be seen that the piece of red meat has become coated with a grey deposit, this being often complete in four or five hours. Now touch the grey matter with the point of a wire, and transfer the minute quantity thus taken up to a microscope slide as before, and examine under a high power, when it will be seen that this grey matter is nothing but an enormous number of bacteria, many in a state of restless activity where they are not crowded in zooglea masses which prevent their rapid movements.

Continue these observations from day to day, each day flooding with water and draining after two hours or so. In a few days the solid particles of meat, &c., will become invisible and merged in the mass of black humus into which it is finally resolved.

It is evident that this is precisely what takes place in a slate bed. When the bed is first filled with sewage, and allowed to stand full in a quiescent state for a couple of hours, the solid matters settle on the slates. Until the "living earth" is fully developed, the destructive action is slow, but, in warm weather especially, the organisms rapidly develop and attack the food thus provided for them, exactly as the organisms in a river mud attack the matter deposited thereon from a tidal water receiving sewage, and if the ratio of organisms, food, and air supply are properly regulated, the action proceeds indefinitely without the evolution of nauseous odours.

(4) *Action taking place in respect to Finely-divided Matters, Colloids, &c., during the two hours' quiescence.*—Beyond the action on the coarser suspended matters, the slate bed, like the coke, &c., coarse beds which they are supplanting, exert an influence on those substances which generally come under the head, in practice, of "matters in solution," and are measured in analyses as "albuminoid ammonia," &c. The finely-divided particles are subject to the action of gravity, and if sufficient time be allowed will, by gravitational action, be arrested by heavier particles—slate slabs, for instance—in the same manner as will a chip of wood floating in a stream be attracted by, and adhere to, a boat or other larger particle.

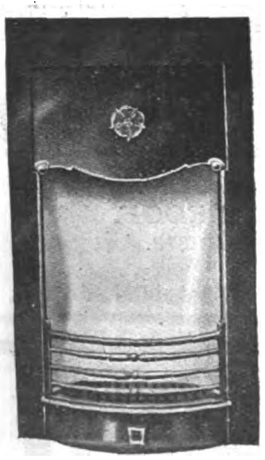
Thus I have elsewhere shown, from experiments I made as far back as 1878, that even molecules of strychnine, morphia, acetate of lead, &c., will be abstracted from solution and stored in the pores of a filter, from whence they can again be washed, and will then appear in the filtrate.

In like manner we can easily understand how the more finely-divided particles of sewage matters, even those in true solution, can be arrested to a greater or less extent, according to the degree of fineness of the pores of the filtering media, and subjected to the attack of living organisms in a filter in the same way that food particles may be distributed among the rocks on a seashore, and there become the prey of the innumerable living creatures abounding thereon.

In this way we have, first (as set out above), mechanical, or, as I prefer to call it, gravitational, retention, and secondly, destruction and oxidation through the agency of living organisms.

It will be noted with interest how far all the modern processes of the last few years are founded on these factors.

(5) *Necessity for Secondary Treatment of Effluent from Slate Beds.*—As the slate beds are but a form of very coarse contact beds, it will be evident that the gravitational action will be insufficient in the case of the finely-divided matters, either in complete or semi-solution, and thus the effluent will seldom be sufficiently pure for final discharge into an ordinary running stream. In certain cases, as those in which the crude sewage to be dealt with is very dilute, the effluent from the slate beds will stand the incubation test for four



(Patent) "HESTIA" GRATES (Patent)

EFFICIENT :: ECONOMICAL :: INEXPENSIVE

Made in a variety of designs as Registers, Mantel Registers, or Interior Grates.

A CERTAIN CURE FOR SMOKY CHIMNEYS.

BURNS ANTHRACITE, COKE or COAL FUEL.

No. 2 Interior, with blower hidden behind the canopy.

SPECIAL FEATURES

SIMPLICITY.—No parts can get out of order. All parts can be removed and replaced by hand.

BLOWER hidden behind canopy always ready for use. Lowered and raised by slight hand pressure. No disturbance of the fire basket and no movement of the fire-bricks.

CHIMNEY DAMPER is automatic. Opening and closing with the pull and push of swing canopy, it checks down draught and prevents escape of warm air from the room.

THE "HESTIA" GRATES HOLD THE CERTIFICATE OF THE INCORPORATED INSTITUTE OF HYGIENE.

We Guarantee Satisfaction.

Digitized by Google

days, and the chemical analysis will show a quality which would permit the discharge into, say, the Thames above lock; but in all ordinary circumstances a further treatment will be required.

Important evidence on this point was obtained by a comparison of the results of an investigation detailed by Prof. C.-E. A. Winslow and Earle B. Phelps in a paper read before the Sanitary Section of the Boston Society of Civil Engineers, on November 15, 1907, on "The Experimental Treatment of Boston Sewage on Sprinkler Beds." On comparing the results obtained with those from the treatment of a sewage of almost exactly comparable character at High Wycombe, on the slate beds, it was seen that the effluents differ essentially in favour of the latter system in respect of suspended matter.

The Boston effluent showed an increase from 9.4 to 9.7 grains per gallon, whereas the High Wycombe effluent showed a reduction from 10.2 to 3.6 grains per gallon. The reduction of organic nitrogen in the Boston effluent was 47 per cent. against 46 per cent. of albuminoid ammonia in the High Wycombe effluent.

The incubation test in both cases gave no fermentative change, and the conclusion is clearly that treatment of Boston sewage on slate beds similar to those at High Wycombe would give better results than those obtained by trickling filters. Further, the number of acres of beds 8 feet deep would be 23 for slates, against 50 required for trickling filters, as the number of gallons daily treated per cubic yard of bed was only 155 for trickling filters at Boston, against 336 for slate beds at High Wycombe.

The following table shows the comparative results:—

	Boston.		High Wycombe.	
	Sewage.	Effluent.	Sewage.	Effluent.
Suspended matters	9·4	9·7	10·2	3 6
Alb. ammonia	0·20*	0·11*	0·15	0·08
Free ammonia	0·98	0·73	1·05	1·07
Oxygen consumed	3·01†	1·75†	0·48‡	0·34‡
Percentage reduction:—				
Organic nitrogen	47		46	
Oxygen consumed	42		29	
Suspended matters	Increased by 9 per cent.		Decreased by 62 per cent.	

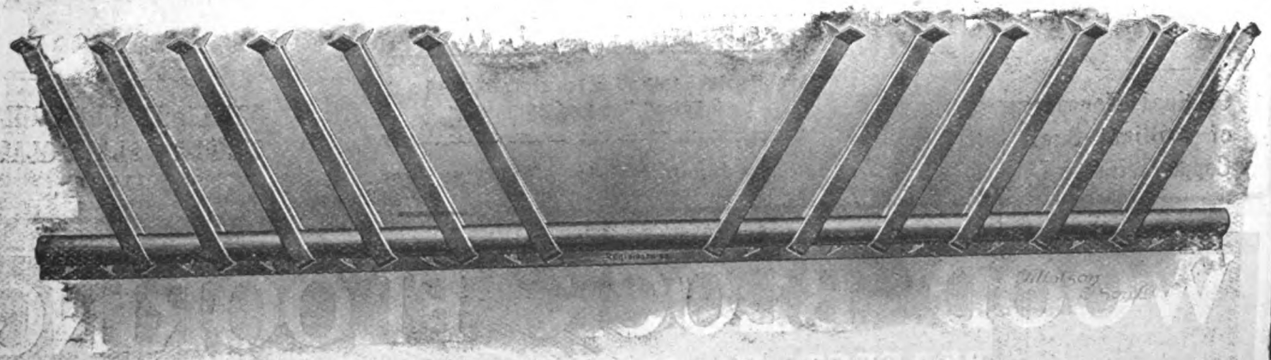
* = ½ kjeldahl. † = at boiling point. ‡ = 4 hours at 80 deg. F.

The ability of a slate bed effluent obtained under favourable conditions to stand the incubation test for four days was confirmed by the results of the treatment of the sewage of Belfast, when the suspended matters were reduced from 20.4 to 0.93 grain per gallon, equal to 95.5 per cent. reduction. When the beds were filled once daily the purification by the albuminoid ammonia test was equal to 47 per cent., and when filled three times daily to 34 per cent., the resulting effluents being such as would be admitted to ordinary inland rivers.

When secondary treatment is necessary, as in the majority of instances, the discussion of the action of the slate beds is not affected, as they have done their work, but it may be as well to point out in this connection that as the great object of sewage treatment is to avoid nuisance, the process which accomplishes the work with the minimum risk of nuisance would obviously be the one to be preferred. Also, that if one of the first laws of mechanics—viz., the avoidance of friction, in other words, "working parts"—is equally to be observed, then the contact beds have in fact, as well as in historical record, the first place. On this point the Fifth Report of the Royal Commission on Sewage Disposal, issued in 1908, is very emphatic. On page 321, "Summary of Conclusions and Recommendations," they say, "The risk of nuisance from smell is greater with percolating filters than with contact beds."

"With percolating filters there is apt to be nuisance from flies, especially with filters constructed with coarse filtering material."

Fine contact beds, such as those at Barking (1 acre), Sutton, Leatherhead, Ewell, Cobham, &c., have been steadily at work in some cases for sixteen years without giving any trouble, and, on the showing of the Royal Commission, are less likely to cause nuisance than the more modern percolating filters which have moving gear, require frequent cleansing, and are more likely to cause nuisance both from smell and flies than the older method which they claimed to displace.



If maximum efficiency, therefore, be the object, there is no question but that the contact beds are the best.

(6) *Extent to which Secondary Treatment should be Carried.*—This entirely depends upon local conditions. If the discharge of the final effluent is to be into a tidal estuary,

Avoid uncertainty and worry by insisting on your Concrete being reinforced with

The PERFECTOR TRUSSED BAR

the **only** Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.

&c., away from possible risk to oyster, &c., fisheries, then, in many cases, there need be nothing beyond the primary treatment on the slates. If the shell-fish question, or possible contamination to water supplies has to be considered, then doubtless secondary treatment on fine contact beds, followed by sand filtration, or sterilisation by chlorine, ozone, &c., will be desirable.

As an instance of sand filtration, the installation for the treatment of the sewage from the county asylum of the Surrey County Council at Netherne will be of interest.

In this case the site is surrounded by various deep wells in the chalk supplying considerable populations, and as there is no brook, &c., for the effluent to be sent into, it must all be disposed of by irrigation on the surface of the ground on the top of the chalk hills on which the asylum is situated.

The process adopted, therefore, is somewhat drastic.

In the first place, it must be mentioned that, as in the case of all asylums, the laundry water occupies a prominent feature in the question, and in order to prevent the beds being alternately dosed with hot concentrated soapy water at one time, and then with sewage, a special laundry water tank is provided into which a separate drain from the laundry discharges.

The outlet from this tank is so arranged that the tank is continually discharging into the main sewer carrier, feeding the slate beds, and at such a rate that on each Monday morning the laundry water tank is completely empty. Thus this tank acts as a cooling, mixing, and regulating tank.

The main sewage carrier, with the proportionate quantity of laundry water, feeds a series of six slate beds, from whence the effluent discharges on to six medium clinker beds, thence to six fine clinker beds, and thence to two sand filters, only one of which is at work at one time, and from thence to distributing channels on the land.

In most cases it is sufficient to adopt only a secondary treatment on fine contact beds. But if these beds are not properly constructed, as is the case in too many instances, the effluent may not at all times comply with the requirements of the river authorities, and in that case one of the most simple and efficacious expedients is to allow the effluent to flow over grass land to effect further clarification both by deposition of any suspended humus, gravitational action, as in a contact bed—the stems of the grass, &c., acting as contact media—and aëration, with the result that a bright effluent will be at all times obtained, such as those from contact beds properly made and worked. A similar result can be secured on heavy clay lands by burning the clay and replacing it as a layer on the surface. In this way an excellent effluent is obtained in the case of one installation of slate beds, the effluent from which simply flows over the layer of burnt ballast, and thence over the grass land to the river.

It will thus be seen that the slate bed system is the most economical and efficacious for the treatment of the solid matters in the sewage, and does, in fact, abolish the sludge difficulty, and enables an excellent effluent to be secured by the most simple and least expensive means, which at the same time are less liable to nuisance than other methods. Thus, by the combination of slate beds with fine contact beds we have, in fact, as indicated by the Royal Commission in their various reports, perfect freedom from nuisance in all stages of the process, and we must therefore have the maximum of efficiency, as the whole crux of the sewage question is summed up in one word—"nuisance"—to show how to abolish which the Royal Commission has itself expended large sums and given much valuable time. Slate beds constitute the only known method of abolishing the sludge nuisance, and that at practically but little working cost, while the fine contact beds finish the work, also without involving the use and consequent repair of working parts, and with the minimum expenditure for labour and renewals.

A Local Government Board inquiry was held at North Ormesby, near Middlesbrough, by Mr. A. G. Drury, M.Inst.C.E., into an application by the Council for a loan for main sewerage works for North Ormesby. The scheme consists in the relaying of part of the present outfall sewers and the construction of new intercepting sewers for the relief of the existing branch sewers and for the future development of the district. About three miles of sewers, varying in diameter from 24 inches to 9 inches, will be laid, with manholes at each change of direction and gradient. New manholes and ventilators will also be constructed on the existing sewers. The scheme was explained by Mr. D. Balfour, junr., M.Inst.C.E., representing the engineers, Messrs. D. Balfour & Son, of Newcastle-on-Tyne and London.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable subsiance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

FRAZZI FIRE-RESISTING CONSTRUCTION

& BROWN'S POROUS BRICK PARTITION.

Works: London & Manchester. **Telephone: 7014 Manchester.**

FIRE-RESISTING PARTITIONS & FLOORS, STANCHION & GIRDER ENCASINGS.

Our partitions are made in four thicknesses, viz.: 1½ in., 2¼ in., 3 in., and 4 in. These blocks are manufactured with a perfect surface for plastering, and the top and bottom edges key to give lateral strength.

Full particulars for any requirements will be supplied by the Sole Representatives in Lancashire, Yorkshire & Cheshire:

J. M. TUTIN & CO., 46 DEANSGATE ARCADE, MANCHESTER.

To Architectural Students.

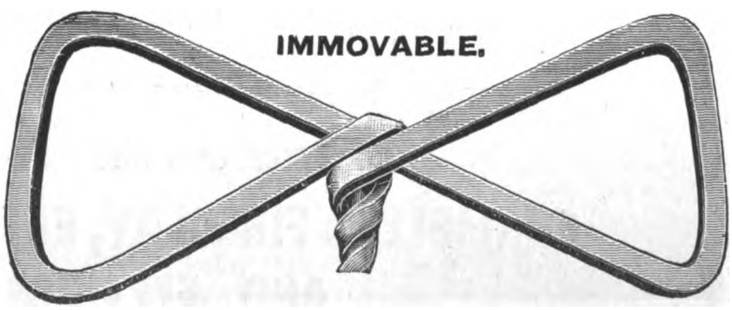
Back Volumes of **THE ARCHITECT** will be found to be of great value to you, containing as they do fine examples of measured drawings, perspective work, and details; all of importance to you in your studies. **Call at the Offices, 6-11 Imperial Buildings, Ludgate Circus, E.C.,** between the hours of 10 A.M. and 5 P.M. on any day but Saturday, and ask for some back volumes to look through. Cost of each volume, containing over 100 examples, is **12s. 6d.**

P. A. GILBERT WOOD, *Publisher.*

PATENT WALL TIES.

Used by H.M. Government.

All TIES Made from MILD FLAT STEEL.



Galvanised or Coated with Special Protective against Oxidation.

OVER 10,000,000 TIES HAVE ALREADY BEEN USED.

ADVANTAGES OF CAVITY TIE.

Perfect Bond with Brickwork.

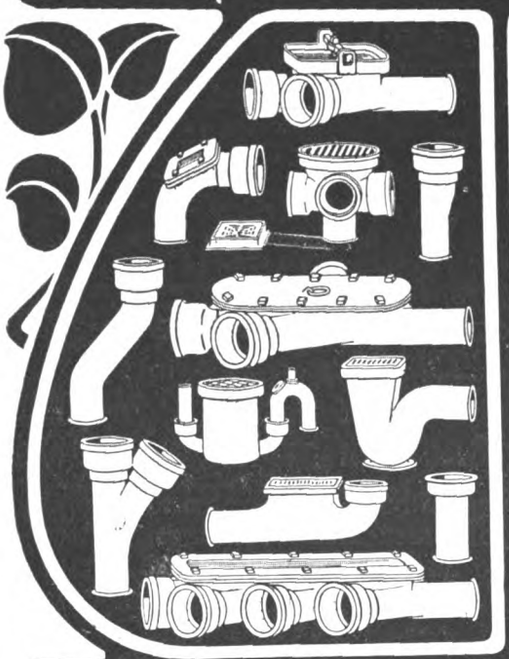
The greatest possible strength with the least possible material.
Cheapness. Its construction shows that no cheaper Bond can be made.
Forms no obstruction in the cavity for mortar and other matters to lodge upon.
Cannot hold or convey damp or moisture.
Obviates the necessity of through Headers in Faced Walling.

ADVANTAGES OF SOLID TIE.

Perfect Bond with Brickwork.

Greater Economy and stability in Faced Walling.
Two straight and plumb faces to brick lengthwork.
In 12's wire for stock or other fine jointed facing.
In 10's wire for common work and outside Walling.

MADE in any LENGTH & STRENGTH for CAVITY or SOLID WORK.



Specified by the Leading Architects, and used by the Principal Builders throughout the Country.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

Walkden (Lancs.).—Nov. 6.—For erection of a technical school at Walkden, for the Worsley Urban District Council. Deposit 3*l.* Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

Widnes.—Nov. 13.—For the enlargement and extension of the Widnes Municipal secondary and technical school. Deposit 3*l.* Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

Wrexham.—Nov. 10.—For supplying and fixing glass roofs to the balconies at the new workhouse infirmary. Mr. J. Price Evans, Argyle Chambers, Wrexham.

Wrightington, near Wigan.—Nov. 8.—For erection of an elementary school to accommodate 120 children. Deposit 2*l.* Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

Owing to leakage in the Redhill reservoir, the Castleford Urban District Council consulted Messrs. D. Balfour & Son, of Newcastle-on-Tyne and London, on the matter, who reported that in their opinion the leakage could be stopped by the construction of a new ferro-concrete bottom and lining of the walls of the reservoir. There are fissures under a portion of the reservoir, and the bottom has been designed of sufficient strength to span over any of them. The work has been let to the Yorkshire Hennebique Contracting Company.

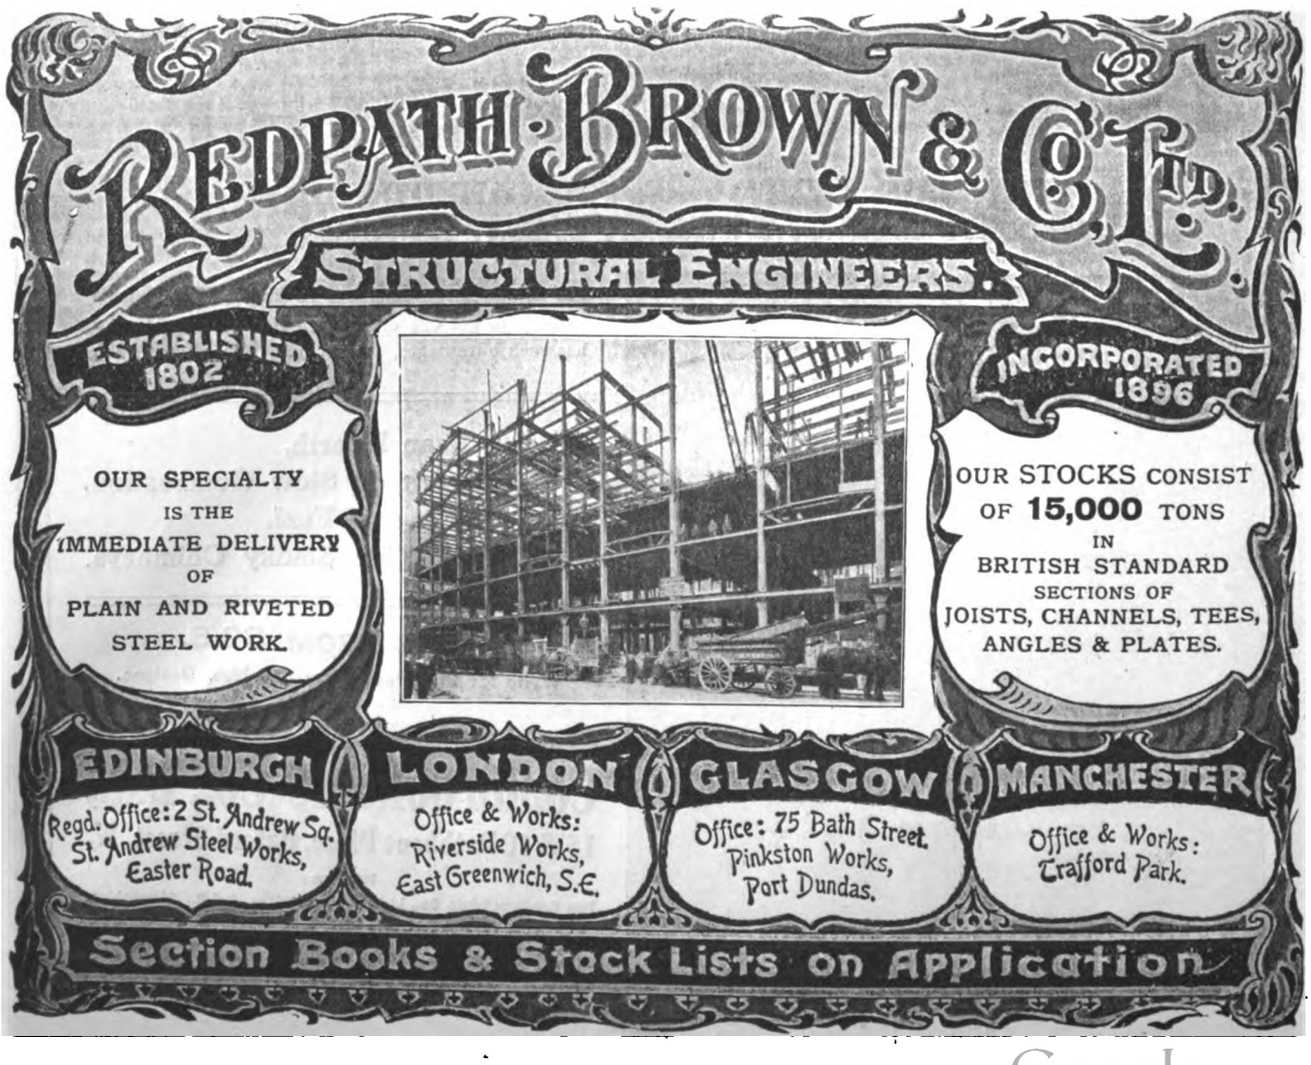
WORDSLEY.

For erection of Lawnswood Road Council school.

Gough & Son, Wolverhampton (*accepted*)	£3,750	0	0

The Heston and Isleworth District Council is about to start an experiment in training municipal officials by means of pupilships open to local youths by competitive examination. Three pupilships will be available in each of the departments of the clerk, the surveyor, the medical officer, and the electrical engineer. The boys will be trained for five years, receiving a salary of 26*l*., and 39*l*. in the last two years. The system of allowing premium pupils will cease.

TRADE NOTES.



Messrs. Arthur L. Gibson & Co., Radnor Works, Twickenham, inform us their Kinnear patent steel rolling shutters were used in the fire-prevention improvements carried out at the Mansion House, London, E.C. These shutters were introduced in some of the most important openings, including the large one between the Egyptian Hall and the Saloon.

Messrs. E. H. Shorland & Brother, of Manchester, have recently supplied their warm-air ventilating patent Manchester grates to the Somerset and Bath Asylum, Wells. Among other work being carried out by the firm is the following:—The Empire Skating Rink, Warrington, is being ventilated by means of Shorland's patent exhaust roof ventilators; the extensions to the Croydon Union workhouse are being warmed and ventilated by means of Shorland's patent Manchester grates; and the Stewkley schools, Bucks, are being warmed and ventilated by means of Shorland's patent Manchester stoves.

Messrs. J. G. Childs & Co., Ltd., electric and hydraulic engineers, Willesden Green, N.W., have just obtained an order from the War Office for three lifts for the Royal Army Clothing Factory at Pimlico; and also another order from the London, Brighton and South Coast Railway for a crane for Brighton, making the third supplied this year.

The Painters' Company give notice that they will meet on December 8 to elect pensioners in connection with the Charities to Aged Blind Men and Women. Particulars may be obtained of Mr. T. H. Pritchard and Mr. F. W. Englefield, clerks, Painters' Hall, Little Trinity Lane.

The Plymouth Corporation land committee have been considering the need for the renovation of the interior of the Guildhall, and recommend that the borough surveyor should proceed with the pointing of the walls and other external work to prevent damp finding its way into the interior, and also that schemes, estimates and specifications for the redecoration of the interior of the Guildhall should be invited from art decorators, with a view to the cost being included in the estimates for the next financial year.

BUILDING AND BUILDERS.

Mr. R. G. Cowe, architect, Chester-le-Street, is preparing plans for a theatre to be erected in Chester-le-Street.

Mr. Charles Dorman, one of the directors of Messrs. Dorman, Long & Co., ironmasters, has been adopted as the Unionist candidate for Middlesbrough at the next election.

The East and West Molesey Urban Council have agreed to the expenditure of 4,165*l.* on the erection and equipment of an isolation hospital.

The Court of Common Council have agreed to the expenditure of 8,500*l.* in the provision of chill-rooms at the Metropolitan Cattle Market.

The borough surveyor at Wrexham has been instructed to prepare a plan and estimate of the cost of a lodge proposed to be erected at the new park and of designs for fencing and entrance gates.

Mr. Frank Freeman, architect, Bolton, is preparing plans for a parish church to be erected at Abram, near Wigan. Mr. Freeman was architect for the church of Holy Trinity, Failsworth, which was consecrated recently by the Bishop of Manchester.

The finance committee of the Exeter City Council recommend that application be made to borrow 2,116*l.*, the cost of enlargement and adaptation of the disused school premises in Cowick Street, for the purposes of an elementary school for infants and junior girls

The building by-laws sub-committee of the Portsmouth Town Council have completed the work of revision, and it was decided on Tuesday to forward the amended Act to the Local Government Board for confirmation. A local association of speculative builders has been formed to protect the interests of the speculative builders and to protest against the statements made recently by members of the Council relative to the quality of work put in speculative houses.

At Falkirk Dean of Guild Court last week warrants were granted for the erection of property worth several thousand pounds. The Olympia (Falkirk), Ltd., had plans approved of a skating rink to be built in Hope Street at a cost of between 3,000*l.* and 4,000*l.* In addition plans were passed by the Court for a public-house in High Street, as well as villa residences and cottages in various parts of the town.

The action of the Derby education committee in inviting tenders "from Derby firms only," for the erection of the new school on the Kedleston Road site, has not met with the approval of the district auditor, who, in his report, expresses the opinion that the best interests of the ratepayers as a body are not served by tenders being thus restricted.

The buildings committee of the First District of Renfrew, N.B., have during the five weeks ending October 11 granted linings of the total value of 35,860*l.*, as compared with 16,050*l.* for the corresponding period of last year. Among the plans lodged were the following:—Terrace of sixteen cottages in proposed street on Braidbar Estate, Giffnock, for Messrs. Robertson & Gow, 175 West George Street, Glasgow; terrace of eight cottages in Mossgeil Road, Newlands, for Messrs. George Eadie & Sons, 405 Mathieson Street, Glasgow; four double villas in proposed new street at Giffnock, for John Taylor, Eddlehurst, Larkhall.

VARIETIES.

The Widnes Town Council have instructed the borough engineer to prepare plans and estimates for the erection of an electric lighting station, with a view to the possible adoption of a municipal supply. The Council have been negotiating with a local company for a public supply.

The Glasgow Corporation sub-committee on air purification have had before them a report prepared by the sanitary inspector, the gas engineer and the Corporation chemist on the effect which the more general use in dwelling-houses of gas stoves for cooking purposes would have on the atmosphere. It is to be considered at a future meeting.

The Nottingham Corporation have adopted a resolution by which the general purposes committee, and all other com-

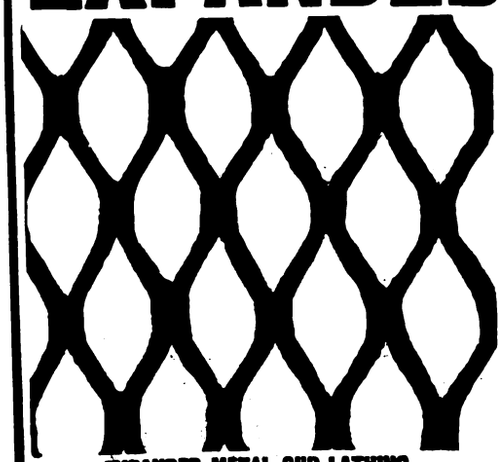
mittees concerned, will have to limit the proposed widening of Carrington Street to a total width of 70 feet, instead of 80 feet as agreed upon. This alteration will effect a saving of 7,000*l.* The total cost will be 35,000*l.*

The Co-Partnership Tenants, Ltd., have after prolonged negotiations secured some 1,500 acres of ground between Wavertree and Childwall, near Liverpool, for the purpose of forming another garden city capable of accommodating 40,000 people. Another scheme is for the erection of about 260 houses in a garden city to be erected at Bromborough Port, Cheshire.



The attendances at the Exhibition of Cottage Designs organised by the Council of the Royal Manchester Institution in June have been very satisfactory—more than 24,000 persons at the City Art Gallery during five weeks and 29,000 persons at the Queen's Park Branch Gallery during six weeks. The designs have been removed to the Art Museum in Ancoats, where they will remain on view until the middle of November.

Mr. R. J. Lovell, architect, 46 Queen Victoria Street, London, E.C., has prepared a scheme for the Aviators Finance, Ltd., a London syndicate, for a great international aviation centre at Lancing, near Brighton. The scheme comprises an extensive club building, stands to accommodate between 10,000 and 20,000 people, a golf club house, sheds for the flying machines, and all other necessary buildings. The project is supported by the Mayors of Hove, Worthing and Brighton and the London, Brighton and South Coast Railway Company.

The Council of the Institution of Civil Engineers have made the following awards for the year 1908-9:—Telford gold medals to Professor B. Hopkinson, M.A., B.Sc. (Cambridge), and Mr. G. R. G. Conway (Monterrey, Mexico); Watt gold medals to Messrs. D. A. Matheson (Glasgow) and W. C. Popplewell, M.Sc. (Stockport); George Stephenson gold medals to Messrs. E. H. Tabor (London) and A. J. Knowles, B.A. (Cairo); the "Indian" premium and a Telford premium to Mr. T. R. Nolan, B.E. (India); Telford premiums to Messrs. S. J. Reed (Newcastle), C. T. Purdy (New York), L. A. B. Wade (Sydney), G. Hobbs (Accra, West Africa), W. Cleaver (Port Talbot), J. D. W. Ball (London), Professor A. H. Gibson, D.Sc. (Dundee), and R. D. Gwyther, M.Sc. (Buenos Aires); the "James Forrest" medal and a Miller prize to Mr. J. A. Wotherspoon (Glasgow); the Miller scholarship to Mr. J. A. Orrell (Manchester); the "James Prescott Joule" medal and Miller prizes to Messrs. W. E. Fisher and E. B. Wood (London); Miller prizes to Messrs. W. E. R. Gurney (London), E. G. L. Lovegrove (London), J. Purser (Birmingham), G. C. Minnitt (Manchester), S. F. Deacon (Manchester), C. H. Bradley and A. E. Marshall (Birmingham).

The Labour Department of the Board of Trade have issued a report dealing with the changes in rates of wages and hours of labour in the United Kingdom in 1908. So far as could be ascertained over 963,000 workpeople (changes affecting agricultural labourers, seamen, and railway servants are not included) had their rates of wages changed during the year. Of these 119,000 received advances amounting to over 7,200*l.* per week, and 464,000 sustained decreases amounting to 66,400*l.* per week, whilst the remaining 380,000 workpeople had upward and downward changes which left their wages at the same level at the end as at the beginning of the year. The net result of all the changes was therefore a decrease of 59,200*l.* per week. Of the 119,000 workpeople whose wages were increased, 9,000 were employed in the building trades. As compared with the number of workpeople affected by changes in rates of wages, the number whose recognised hours of labour were changed in 1908 was small. It will be understood that the changes recorded do not include temporary alterations in the working hours owing to changes in the state of trade or regularly recurring seasonal alterations as in the building trades. The changes reported affected 26,541 workpeople, of whom 3,349 had their aggregate working time increased by 5,686 hours per week, and 23,192 had reductions amounting to 44,109 per week. The net effect of all the changes was thus a reduction of 38,423 hours in the weekly working time of the people affected. The changes in rates of wages taking effect in the first six months of 1909 showed that the downward movement in wages which commenced in 1908 was still maintained. In every group of trades, with the exception of clothing, printing, and employees of local authorities, the changes resulted in net decreases, the net amount of valuation being 67,744*l.* per week.

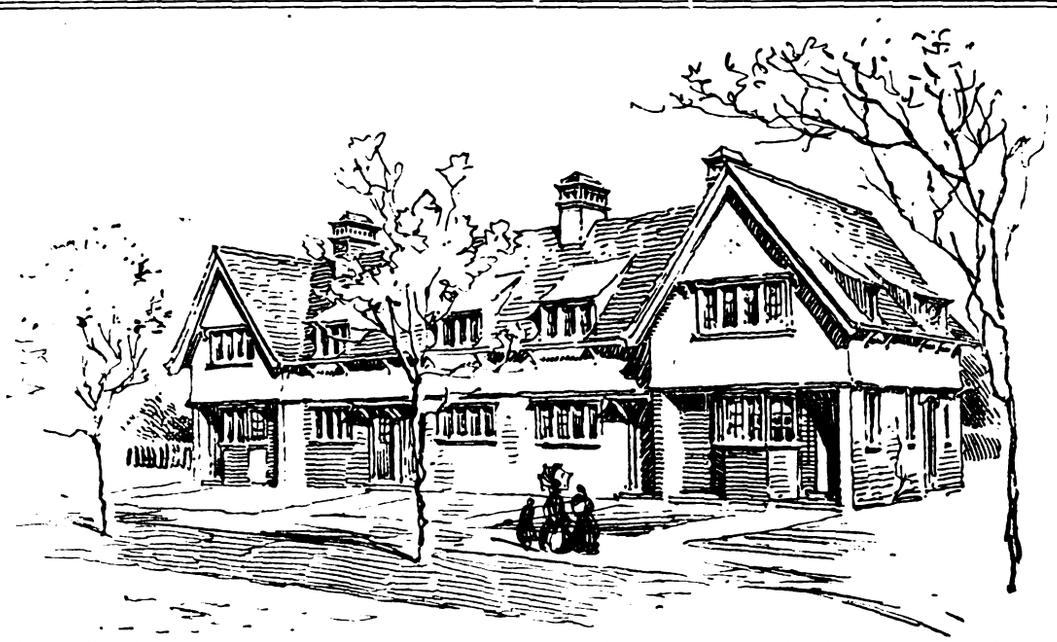
HEREFORD GARDEN CITY.



HEREFORD CO-OPERATIVE HOUSING, LTD.—SOUTHERN PORTION OF ESTATE.
MESSRS. GROOME & BETTINGTON, Architects, Hereford.

FOR several years the medical officer of health and inspector of nuisances at Hereford reported to the Council that much of the cottage property in the city was in so bad a state of repair that it could not be reasonably rendered habitable; and that more and better cottage accommodation was urgently required. On the instructions of the sanitary com-

mittee a systematic inspection of insanitary properties in the city was carried out a couple of years ago, and the reports showed that, of the houses visited, 156 were in so bad a condition that they should be closed for human habitation. The city surveyor also inspected the properties, and he stated that 75 per cent. of them were past repair, and that the greater number of the remainder were in such a bad state of repair that it would be unprofitable to make them habitable. From inquiries made, the Council were satisfied that there was an undoubted scarcity of cottages in the city at rents within the means of unskilled labourers, and it was ascertained that in February 1908 only one cottage below the rent of 5*s.* per week was then vacant. The Council were hampered in their efforts to obtain the closing of insanitary premises by reason of there being no accommodation for the displaced tenants, and on that account, except where absolutely necessary, took no proceedings with regard thereto. With the view of the provision of such accommodation and to effect the closing of the houses reported as unfit for human habitation, the Council agreed with Sir Edward Hopton, K.C.B., to purchase for the sum of 1,500*l.* a site comprising 9 acres, 1 rood, 6 poles of land, situate near the Barr's Court

railway station in the city. This land is highly suitable for the erection of workmen's dwellings, being within easy reach of the majority of the industrial businesses of the city, and having a large frontage to an existing road.

To meet the new condition the society known as the Hereford Co-operative Housing, Ltd., was established. The committee obtained an option to purchase, or lease with an option of purchase, this land other than the roads (or so much of it as the capital raised will permit the use of) at such a price as would recoup the Corporation their outlay in connection with it. It is not intended that the houses to be erected will be occupied by the tenants from the condemned houses. Accommodation for them is expected to be found in the houses vacated by those who will become the Co-operative tenants.

The capital consists of ordinary shares paying a dividend of not more than 5 per cent., and loan stock paying 4 per cent. The loan stock has priority to the ordinary shares, and is transferable, but not withdrawable. But the Society reserves the right to repay the whole or any part (to be chosen by lot) at par, on giving six months' notice. The ordinary shares are 1*l.* each, payable not less than 1*s.* on allotment. No member may hold more than 200*l.* ordinary shares. The loan stock shares are 5*l.*, payable not less than 5*s.* on allotment. A member may hold an unlimited amount of loan stock, but only ordinary shares confer votes. Any surplus profit, after paying dividends not exceeding the above and providing for repairs, depreciation, &c., is divided among the tenant members in the shape of shares, the non-tenant investing members being gradually paid out. The tenant members have thus a direct interest in improving the investors' security by taking care of their houses and introducing good tenants. The tenant members' share capital also affords a security for the rent.

The Hereford Co-operative scheme is one of the latest examples of what can be done to satisfactorily and eco-

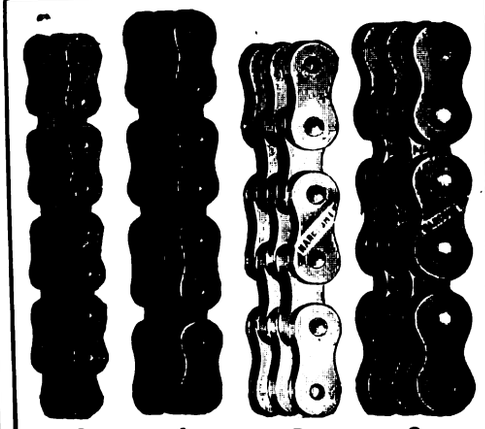
nomically solve the problem of housing the working classes. One of the features of the Hereford scheme is the studied irregular distribution of the cottages upon the site. In the Hereford scheme the roads are designed upon Continental lines, the road itself being edged each side with a 7 feet 6 inches wide strip of turf, and along the other side of these breaks of greensward comes the 5-foot wide footpath. On no part of the estate are there more than twelve houses per acre. The cottages themselves are set back 15 feet from the edge of the footpath; there is therefore a total width of 70 feet from houses on one side of the road to houses on the other side. The cottages are models of economical planning, and are most picturesque and cosy in appearance, the architectural style being reminiscent of the Old English cottage, but the walls being cement rough-cast and the roofs covered with Broseley tiles. All the rooms are plastered and papered. Some have a good-sized parlour and upstairs bathroom, whilst all have a commodious kitchen and scullery and a direct lighted and ventilated larder. There is an absence of the usual outbuildings at the back. This difficulty is got over in an ingenious manner, the w.c.'s and coal stores being dovetailed into, without apparently encroaching upon, the main block of the cottage; both w.c. and coal store being in some cases entered from outside, whilst in other cases a clever arrangement is provided for additional access to the coals from the scullery, without going outside, in the wet weather for instance. Another ingenious feature to be found in some of the cottages is Corne's patent combined range and wash boiler; the bath in these cottages being in the scullery, and when not in use is covered with a folding table-top. The rents of the cottages built at present are 4*s*. 9*d*., 5*s*. 3*d*., 5*s*. 6*d*., 5*s*. 9*d*., 6*s*., and 7*s*. 9*d*. (all include rates and taxes). It should be stated that the idea of the committee is to suit the pockets of the working men earning 15*s*. to 1*l*. per week and from 25*s*. to 30*s*. per week. The drawings of the Hereford scheme have recently been on view at the Manchester Art Gallery, the Queen's Park Art Gallery, and the Manchester Art Museum. Messrs. Groome & Bettington, the architects to the scheme, have since been requested by the Corporation of Bury to loan them the drawings for an exhibition which this body are holding with a view to promoting a housing scheme in that township.



THE WIDENING OF FLEET STREET.

On Tuesday last the London County Council agreed to the contribution of 200,000*l*. towards the scheme of the City Corporation for completing the improvement of Fleet Street. The Council has on various dates since 1896 agreed to contribute half the cost of widenings of Fleet Street proposed by the Corporation. The total cost of these widenings was estimated at 270,174*l*., and the contributions agreed to by the Council are therefore estimated to amount to 135,087*l*. The general width adopted for the widened road was 60 feet. The Corporation has now prepared a scheme for widening the remainder of the road to 60 feet except at those parts where the width is only a little less than this and, subject to the Council contributing half the cost, it has decided to proceed with the improvement. The road at present has a minimum width of only 48 feet 6 inches. A deputation from the improvements and finance committee of the Corporation strongly urged that the Council may be recommended to make the desired contribution. The deputation pointed out that, as the premises which have been acquired and set back to the new frontage are recessed, they are difficult to let, and that loss of trade and loss of rates are thus caused. On the other hand the value of property in Fleet Street is, in general, rapidly increasing, so that the longer the execution of the improvement is deferred the more costly will it prove. The rateable value of property in the City which in 1858 was 1,250,000*l*. had increased in 1896, when the first widenings of Fleet Street to 60 feet were undertaken, to 4,423,000*l*., and in 1908 to 5,470,000*l*. Delay would also afford opportunities for the creation of fresh interests, particularly in the property which is let on lease. The acquisition of these interests would entail additional heavy expenditure. A great part of the property needed is occupied by the freeholders and has, in most cases, been rebuilt comparatively recently. No favourable opportunity for dealing with this property is likely to occur for many years. The deputation considered that an application to Parliament for special powers for the compulsory acquisition of property would lead to unnecessary delay and that it would be more economical for the Corporation to proceed under its existing compulsory powers.

The cost of the improvement was originally estimated by the Corporation at 500,000*l*., but the London County Council

improvements committee are informed that, owing to the omission of certain properties, it now estimates the cost at 415,600*l.* The valuer is of opinion that the cost of the widening should not exceed 400,000*l.* It is the usual practice of the Council to base its contributions towards the cost of local improvements on estimates prepared by its officers and approved by us. The committee have approved the estimate of 400,000*l.* and they think that any contribution should be based thereon. The Council, by its contributions in past years, has fully recognised the importance of the thoroughfare and the necessity for widening it. The improvements committee are strongly of opinion that the Council should now co-operate with the Corporation in completing the improvement, in order that the present congestion of traffic may be relieved, and that full benefit may be derived from the widenings already executed. The deputation suggested that the Council's total payments in any one year in respect of the improvement should not exceed 50,000*l.* The Corporation has since stated that it desires, as far as possible, to consult the convenience of the Council as to the payment of its contribution, and it suggests August 1, 1910, for the payment of the first instalment. On this basis the contribution would be spread equally over the four financial years, 1910-11, 1911-12, 1912-13 and 1913-14.

The improvements committee recommended:—

(*a*) That the estimate of expenditure on capital account of 200,000*l.*, submitted by the finance committee in respect of the widening of Fleet Street at Nos. 13, 14, 15, 16, 21, 22, 47, 49, 50, 52, 54, 55, 55A, 57, 58, 60, 61, 62, 68, 70, 72, 73, 74, 75, 77, 78, 80 and 81, be approved as an estimate of costs, debt or liability under section 80 (3) of the Local Government Act, 1888.

(*b*) That expenditure on capital account not exceeding 200,000*l.* be sanctioned in respect of the widening of Fleet Street as specified in resolution (*a*); that a contribution be made, on the usual conditions, of one-half of the net cost of the widening, provided (i.) that, if the total net cost exceed 400,000*l.*, such contribution shall be limited to 200,000*l.*; (ii.) that, in the execution of the improvement, no departure whatever be made from the approved plan, except with the previous sanction of the Council; and (iii.) that the total amount to be paid by the Council in any one year be limited to 50,000*l.*

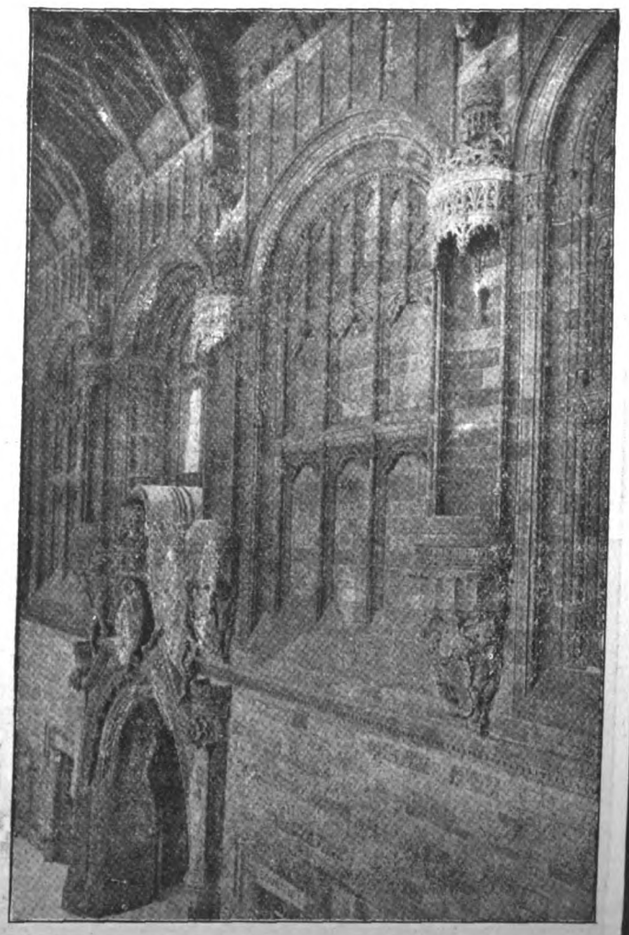
These recommendations were discussed at the meeting of the County Council on Tuesday, and were adopted by a majority.

The finance committee submitted a report at the same time in which they expressed the opinion that provided proper provision is made in the annual estimates, and provided also that the expenditure on the improvement incurred by the City proceeds at approximately the same rate proportionately, *i.e.*, about 100,000*l.* a year at least, they saw no objection, from a financial point of view, to the adoption of the City Corporation's suggestion if the Council agrees to the improvement being carried out.

The following information was given as to the present position of the Council in regard to its capital commitments in respect of street improvements generally. The proportions chargeable against the tramways account are included:—Commitments as on September 30, 1909, on estimates of costs, debt or liability approved to date, including balances of contributions promised to the City amounting to 379,316*l.*, of which 14,518*l.* is in respect of Fleet Street widenings most of which will be absorbed by the present proposal—approximately 1,900,000*l.* Commitments attendant upon legislation of 1909, in respect of which estimates have not yet been put forward (including Woolwich footway tunnel), 145,000*l.*; total, 2,045,000*l.*

LONDON MASTER BUILDERS' ASSOCIATION.

A SPECIAL general meeting of the London Master Builders' Association was held on Thursday, October 21, for the purpose of making amendments in the rules of the Association.



Mr. F. G. Rice (President) occupied the chair, and explained that with a view to enlarge the sphere and usefulness of the Association the Council had decided to obtain the necessary authority to alter that portion of Rule 3 which relates to the subscription of Associate members. He said, in the course of his remarks, that it has long been felt that many merchants were desirous of being identified with and assisting the work of this Association, and the object of altering the rule was to give them an opportunity of showing their practical sympathy with its work. The President then formally moved:—

(*a*) That Rule 3 be altered to read:—"Associate members shall pay an annual subscription of 2*l.* 2*s.*"

(*b*) Rule III., section *b*. To add:—"Other things being equal, preference in ordering goods shall be given to builders' merchants who are Associate members."

This was seconded by Mr. F. Higgs, chairman of the organisation committee, and who gave a most interesting account of the work of that committee, explaining that they had devoted much care and thought in their endeavours to extend the Association; and he hoped that present and future members as well as the trade generally would keep constantly in mind the importance of loyal cohesion in their efforts to protect themselves from the various dangers to which the trade is subject. He felt sure that a considerable number of merchants would enrol themselves as Associate members, and he fully explained the scheme of issuing a telephone card containing the names of builders' merchants who will become Associate members for the use of the ordinary members of the Association.

An interesting discussion, in which Messrs. J. Chessum, J. W. Lorden, R. J. Worsley and others took part, followed, and the resolutions were carried unanimously.

The President made an earnest appeal to all present to use their best endeavours to further the work of the Association, and the proceedings terminated.

A Council meeting was held on the same day, when Mr. F. G. Rice (President) presided.

A hearty vote of thanks was given to Mr. Rice and the members of the sub-committee, Messrs. Brown, Higgs and Wallis, for the successful reception of and dinner to the Belgian master builders who visited London in August last.

The organisation committee's report was adopted, and the references from the special general meeting respecting the alterations in the rules were received.

The Council also made such additions to the pamphlet, entitled "The Objects of the Association," as recent times and current events demanded, and much satisfaction was expressed to Mr. F. Higgs for his able and suitable amendments of and additions to the old pamphlet. Proofs were ordered to be printed and laid before the Council at their next meeting for further consideration and adoption.

The President reported the proceedings of the conference held on the 13th inst., and submitted three resolutions passed on the occasion respecting tendering without quantities. The conference was promoted by the Quantity Surveyors' Association, and was attended by representatives of the Institute of Builders, the National Federation, and this Association. The Council felt that the subject discussed was a most important one and ordered that copies of the resolutions should be sent to each member of the Council, and that the matter be further considered at their next meeting.

The resolutions referred to were as follows:—

1. That the Conference disapproves of the practice of asking for tenders in competition for works of a substantial value without quantities, prepared by a fully qualified quantity surveyor, being supplied, and is of opinion that such quantities should be supplied in all cases when competitive estimates are invited for works expected to cost 500*l.* and upwards.

2. That the Conference recommends the Councils of the Institute of Builders, the London Master Builders' Association, and of the National Federation of Building Trades Employers to urge their members to refuse to tender in competition without quantities for works costing 500*l.* and upwards.

3. That a copy of the first resolution be sent to the Royal Institute of British Architects, the Society of Architects, and the Surveyors' Institution.

Two cases involving interesting trade questions referred to the solicitor were reported upon and spoken to by him and the Council, and instructions given.

The request frequently made of requiring priced schedules to be submitted with tenders was discussed, and the Council wishes to approach various bodies by deputation to discuss this question.

The amended national agreement with the N.A.O.P. was submitted, and the National Federation was asked that the correspondence showing that the amended agreement does not supersede the arrangements made in the working rule agreement between the London Plasterers and the L.M.B.A. should be printed and bound up with the intended issue of these new rules.

Various trade questions were discussed, and the Council adjourned after a very lengthy sitting.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public-and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORKER, Ltd.,

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

London Showrooms, Saracen's Head Buildings, Snow Hill, City, W. E. CLARKE, AGENT, where the "Drawwell" can be seen in action.

TRADE NOTES.

THE hackneyed quotation, "Times change and we with them," might well be adopted as the motto of Messrs. J. Tylor & Sons, Ltd., for after a career extending over one hundred and thirty years they are still abreast, if not in advance, of the latest ideas in their business. In some industries the impression of being a little old-fashioned is a commercial asset; but this is very far from being the case when sanitary engineering is concerned. Here the successful manufacturer has to be ready to adopt the very latest ideas and (sometimes) to meet the most passing whims. The mere possession of a record extending well over a century is of small value compared with one gained by progressive management and a reputation for up-to-dateness. Fortunately these two qualities of maturity and youthful vigour are not by any means an impossible combination, and when they are found together, as in the case of this firm, the result is most satisfactory. To many of their old customers the showrooms of Messrs. J. Tylor & Sons are no doubt almost ineradicably associated with 2 Newgate Street, E.C. Unfortunately that long-established link had to be broken, and the showrooms are now, and have been for some time, at 232 Tottenham Court Road (which is only three minutes' walk from Oxford Street), though the works continue at Belle Isle, King's Cross, N. The new showrooms well repay a visit, for the entire premises from basement to topmost storey are called into requisition to display the goods turned out by the firm. Messrs. Tylor & Sons do not limit themselves to sanitary goods, for they are also hydraulic engineers,

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

Digitized by Google

brass and iron founders. In the basement there is a large stock of fireclay and earthenware goods, such as urinals, ranges, including the latest patterns, lavatory ranges of many varieties, surgeon's lavatories, sinks and other appliances designed for hospital work, together with much else for particular and general requirements. Here, as throughout the showrooms, numberless examples are to be found of scrupulous care exercised so as to conform with the most exacting demands of hygiene. This is especially marked in the avoidance of concealed or not easily-cleanable parts. It is to be hoped that the physique of the rising generation will be materially improved by the anxious thought and skill lavished on such minute details as a lavatory overflow. Messrs. Tylor & Sons can claim a large share of any credit, for they have supplied sanitary goods to several large colleges, including the naval schools at Osborne, Devonport and Dartmouth, Haileybury College, and elsewhere. Their inventions cover a very wide area. In cisterns alone they have about ten patterns, the latest development of which is the "Regal," a silent, powerful and first-class cistern. Baths are made of almost numberless shapes, sizes and qualities. But it is useless to attempt to describe all that is to be seen at the showrooms, for the mere list at the end of their catalogues fills twelve columns. The only satisfactory way of obtaining an accurate idea of what is being done, and has been done, by the firm to promote the sanitary well-being of the community is to make a personal inspection.

The Falkirk Iron Company have removed from 67 Upper Thames Street, E.C., to Craven House, Kingsway, W.C.

The latest form of cottage bath comes from Manchester. It is the invention of, and solely made by Mr. H. Chadwick, 26 Hawthorn Street, Audenshaw. The two patterns in which it is stocked are alike in the fact that they both combine a bath with the kitchen sink. The fundamental difference of the two is that style A is convertible into a bath 5 feet 4 inches long, while style B has only half that length, and is therefore more in the nature of a bath-tub. In the first kind the upper half turns over and rests on the lower half. When in that position the sink (previously on its under side) stands 2 feet 9 inches from the floor. All the sink's waste water discharges through a waste and overflow pipe on the outside of the bath. The bath and the sink are both filled from the same pipes. This of course obviates the expense of any extra plumbing. Style B is a tub 2 feet 6 inches from the floor, made of rustless sheet metal, enamel finished, with a cover on which a sink 2 feet 6 inches by 1 foot 6 inches by 4 inches is fixed. The cost of the most expensive is under a 5*l.* note, and is in consequence well worth consideration by the owners of small house property, who recognise the demand for such a convenience, but have hitherto been deterred by lack of space and lack of money.

VARIETIES.

New Continental Turbine Steamer.—The Great Eastern Railway Company have ordered another turbine steamer for their Harwich-Hook of Holland service. This vessel will be a sister ship to the *Munich*, and constructed by the same builders, Messrs. John Brown & Co., Ltd., Clydebank, for delivery next summer.

The Illuminating Engineering Society will hold their opening meeting on Thursday, the 18th inst., at 8 p.m., at the premises of the Royal Society of Arts, 18 John Street, Adelphi, London, W., when a brief report of the progress of the Society will be presented by the Hon. Secretary, and the inaugural address will be delivered by Prof. Silvanus P. Thompson, D.Sc., F.R.S., the first President of the Society.

The Kent education committee recommend the raising of loans not exceeding the following amounts:—Paddock Wood Council school (adaptation of premises, heating apparatus, tar paving, &c.), 525*l.*; Cliffe infants' Council school, site, 200*l.*; Minster Halfway Houses Council school, buildings, 1,510*l.*; Sutton Valence Council school, buildings, 2,740*l.*; Swanscombe, Knockhall Council school, site, 400*l.*

The Cadder School Board have under consideration alternative plans submitted by Mr. Fairweather, architect, Glasgow, for an extension of Stepps school. In the one case five rooms are shown added at the back, giving accommodation for 300 children, while in the other case the extension would be two storey, giving eight rooms, or accommodation for 480 scholars. The minor scheme is estimated to cost from 3,150*l.* to 3,500*l.*, while the major is put down at from 4,800*l.* to 5,200*l.*

ILLUSTRATIONS.

SELBY ABBEY.—NEW ROOD SCREEN, DIAGONAL VIEW—THE REREDOS—NORTH SIDE OF NAVE, LOOKING N.-W.—THE CHANCEL.

OXFORD COLLEGE SERIES, BRASENOSE.—BACK QUAD—HALL.

LIVERPOOL UNIVERSITY SCHOOL OF ARCHITECTURE.—DETAIL FROM TRINITY COLLEGE, CAMBRIDGE.

THE opening of the Leavesden Road Baptist Church and Institute, Watford, took place recently. The church is designed in a late period of Gothic freely treated, and will accommodate 700 persons. Externally the building is faced with pressed red bricks with Bath stone dressings; the internal joinery is of pitch pine. The contract has been carried out by Messrs. Chas. Brightman & Son, Watford, and amounts to 4,150*l*. The architects, whose designs were selected in a recent competition, are Messrs. Geo. Baines & Son, of 5 Clement's Inn, Strand, W.C.

THE British Uralite Co., Ltd., of 16 St. Helen's Place, London, E.C., have been awarded a diploma for gold medal for their exhibit at the Imperial International exhibition at the Great White City. The exhibit was a pavilion constructed of the company's well-known fireproof materials uralite and uralite asbestone. The company manufactures solely in England, where it is the only maker of asbestos cement tiles.

THE Lancashire county medical officer, Dr. E. Sergeant, in his annual report deals with the housing of working classes. The report says in the administrative county 164 houses were condemned, 59 were closed, 64 demolished, 184 made habitable. In none of the county districts has sufficient activity been displayed in this direction; some of the rural districts exhibit the worst specimens of insanitary dwellings. Overcrowding is serious in certain districts.

A SMALL holdings experiment is to be carried out through the co-operation of the Woods and Forests Department in a field of about thirty acres on the west side of the King's Park, Stirling. There will be ten houses in the farm colony, with accommodation for a horse and ten cows. The houses are all to be of brick, and will consist of three blocks containing two houses, one block of three houses, and one single house. All are to be equipped with modern conveniences, including baths and cooking ranges. It is expected that the outlay will amount to 3,500*l*. The various contractors, who are all Stirling tradesmen, have been fixed.

THE Liverpool Cathedral Committee met on Monday last. Mr. Gilbert Scott (the architect) reported that the stained-glass windows were ready for insertion in the lady chapel, and asked the committee to close the chapel to the public until the work was completed. It is anticipated that the work will occupy from four to six months. The organising secretary was directed to prepare a history of the cathedral movement from its inception. The additional sum needed to complete the portion of the cathedral now in course of erection is between 60,000*l*. and 70,000*l*. The portion in question includes the lady chapel, the chapter-house, the vestries, the choir, and a portion of the great transept, and will afford accommodation for a congregation of about 2,000. If the funds are forthcoming this portion can be completed in about five years' time.

NEW CATALOGUES.

THE latest catalogue ("B.L.") issued by the Carron Company deals with their baths, lavatories, and sanitary appliances. The Carron ironworks are laid under contribution to supply iron of the finest quality for these goods; it is specially selected and tested so as to make sure of its freedom from the defects which beset the manufacturer's most painstaking efforts. The same care is exercised throughout all the stages of the bath's production. There is, of course, a wide selection of patterns. A useful line is their combination bath and lavatory basin, in which a basin fits into two sockets practically flush with the surface of the bath, and is filled from the combined hot and cold tap. The baths are in all cases both porcelain enamelled and metallic enamelled, the former being in four grades of finish and the latter in two. Twenty designs are given for outside decoration. There are also many different patterns of lavatory stands, as well as taps, wastes, and brackets. Another department of the Carron Company is represented in a pamphlet illustrating their gas fires.

"By fixing the Maximum Daylight Glass directly in the sash the rays of light are refracted towards the rear of the room and at the same time diffused sideways. An even distribution of all the light available is made. This double refracting power of the Maximum makes it effective in

Digitized by Google

many places where ordinary corrugated or plain prismatic glass is of little use beyond projecting a beam of light in one direction only." This explanation is taken from the catalogue of the Maximum Light Window Glass Company, which contains, in addition to much descriptive matter, a large number of photographs showing buildings where the glass has been employed, and a much larger number of names of firms at home and abroad who have used it. Seven pages are required for the London installations alone, and even then the list is only a partial one. It may be safely said that if the Maximum glass is able to justify its claims under the abnormal conditions of the metropolis it will be able to do so anywhere. The last twelve pages deal with "Cat's Eye Glass"—another patent by Mr. E. J. Dobbins. This latter is adapted to serve in decorative positions, and while still increasing the light in the interior, it obscures the view. It is recommended for the outer glazing of doors, windows, skylights, &c.

Laundry machinery as made by Messrs. Smith & Paget, Crown Works, Keighley, ranges from a sixpenny sad iron to a water-heater costing 103*l*. In between these two extremes there come a large number of machines, most of which are triumphs of ingenuity. Their eighty-page catalogue shows the very latest ideas and inventions in connection with their business. Messrs. Smith & Paget have been building up their reputation and increasing their plant during the past forty years, and are now in a position to quote for complete installations as readily as for single machines; moreover, they are prepared to erect the plant and to set it to work.

Messrs. Merryweather & Sons, Ltd., have just issued a catalogue which deals exclusively with pumps and water-raising machinery. A multitude of ways of driving a pump have been evolved since manual force was first employed. The firm have now to manufacture pumps driven by hot air, petrol, steam, electricity, turbine, oil, gas, and others beside. If driven by hand alone there is an almost equally wide departure from primitive methods. Messrs. Merryweather & Son may be relied upon to supply nothing but the best. The conditions under which water is to be obtained differ so greatly that only a firm possessed of exceptionally great resource can hope to succeed. The possession of this will be denied by no one to this firm.

GLASGOW BUILDING REGULATIONS.

Mr. A. W. Myles, Town Clerk of Glasgow, has given notice that, in accordance with the Glasgow Building Regulations Act, 1900, application will be made to the Secretary for Scotland on December 1 for confirmation of the by-laws made under that Act and adopted by the Town Council at their meeting on 14th inst. According to the Act the by-laws must be confirmed by the Secretary for Scotland before they can take effect, and before Lord Pentland gives his decision he may cause such further intimation and institute such inquiry as he may think proper. There are in all 104 by-laws, but most of these are existing by-laws or modifications or amendments of them which are being made to meet difficulties that have arisen in the practical working out of the by-laws made under the 1892 Act, which are at present in force. Attention may be directed to the most important changes.

Prevention of Fire.

To prevent the spread of fire it is set forth in By-law 24:—

The walls enclosing a common stair hereafter built in any building other than a tenement not exceeding four storeys in height shall be carried up 9 inches in thickness above the roof to the extent of 18 inches, measured at right angles to the slope of the roof.

And in By-law 25:—

Where in any building exceeding 100 feet in length a cross wall or party wall is hereafter built through the floor of the highest storey, such wall shall be carried up 9 inches in thickness above the roof to the extent of 12 inches, measured at right angles to the slope of the roof.

By-law 57 provides:—

Where buildings are made of fire-resisting material throughout, and are so designed that the weight of the several floors and the roof is carried by columns and beams in such manner that the external walls of each storey do not carry any part of the weight of the floors above such storey, such walls, if built of brick, concrete, or cube stone, and not exceeding 14 feet in height above the bearing of such walls, shall be not less than 14 inches in thickness.

By-law 103 is as follows:—

In buildings of the warehouse class hereafter erected, all skylights, lantern-lights, and roof-lights, and all win-

Digitized by Google

dows lighted from any street, lane, court, or well which measures less than 20 feet across in any direction, shall, so far as regards the frames and glazing thereof, be constructed of fire-resisting materials and glazing respectively.

Paving of New Streets.

By-law 59 states:—

Unless where the Dean of Guild shall otherwise authorise or require, the following regulations shall apply to the paving of new streets:—Where the gradient is steeper than 1 in 45 and is not steeper than 1 in 25 the street shall be paved with tar macadam not less than three inches in thickness, and laid on a foundation of hand-set stone bottoming not less than nine inches in thickness; where the gradient is not steeper than 1 in 45 the street shall be paved with asphalt not less than 1½ inches in thickness and laid on a foundation of concrete not less than six inches in thickness. No new street shall be paved with rubble causeway.

Fixing of Slates.

At present every course of slates on a roof is double-nailed, the result being that it is impossible to repair these roofs in a satisfactory manner. To remedy this it is now enacted in By-law 33 that slates on roofs hereafter constructed shall "be secured on every third course by at least two strong copper, galvanised iron, or other suitable nails, and the slates on the two other courses by one such nail," except that each slate upon a Mansard roof which is not protected by a parapet at the eaves shall be secured by two nails.

Ventilation of Back Courts.

To make better provision for the passage of currents of air, By-law 62 states:—

When any division wall or fence in or between back courts, courts, or areas is in a state of disrepair, the owner thereof shall, as may be required by notice by the Master of Works, repair the same or substitute therefor an open iron railing.

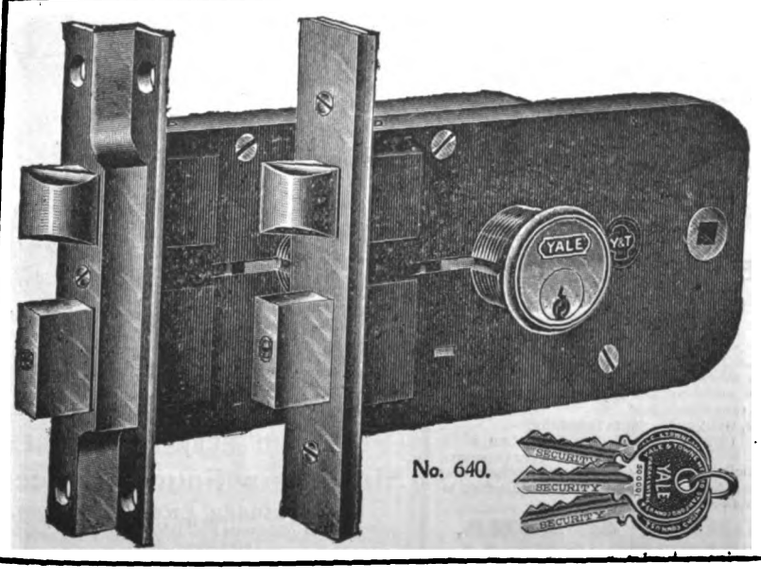
Removal of Disused Sewers.

The authorities have no power under the existing law to compel disused sewers to be removed, the consequence being that these are often allowed to remain in the ground with their foul contents, and there have even been cases where new drains were connected with these obsolete sewers and sewage poured into them until its overflow led to discovery. This is provided against by By-law 99, which says:—

Where any public, common, or private sewer is provided in lieu of any existing sewer which ceases to be used, the person making such substituted sewer shall, on the completion thereof, remove the disused sewer and any contaminated soil surrounding it, and shall thereafter make up the ground with clean material, all to the satisfaction of the Master of Works. Where any public, common, or private sewer ceases to be used the owner thereof, or other person who was liable to maintain such sewer, shall remove the same and any contaminated soil surrounding it, and thereafter make up the ground with clean material, all to the satisfaction of the Master of Works.

Miscellaneous.

As the result of an arrangement between the representatives of the masters and workmen, a by-law has been inserted, No. 92, which provides for the use of substantial gangways, working platforms, or scaffolds during the construction, demolition, alteration, or repair of any building and for the weekly inspection of these.



Another by-law, No. 90, makes compulsory the provision of sanitary conveniences in theatres, music-halls, circuses, halls, concert-rooms, ball-rooms, and exhibition-rooms in proportion to the accommodation of the building.

A PAIR OF COTTAGES, NEWCASTLE-ON-TYNE.

THIS pair of cottages was erected at Walker Gate, Newcastle-on-Tyne, for the Wallsend Industrial Co-Operative Society, Ltd., and was awarded a silver medal in the recent North of England Model Cottage Exhibition. The walls are constructed of hard local bricks, 11 inches thick, with a cavity in centre, and asphalte damp-proof course, and are faced externally with local pressed red bricks up to first floor level, and above covered with two coats Portland cement, dashed with white spar. All floors except scullery, &c., are of wood. The floors of pantry and coals are of concrete, with a smooth Portland cement surface. The roof is covered with Green's best French tiles and half-round ridge tiles. The whole of the windows are wood casements, opening outwards. The architect was Mr. Edward Cratney.

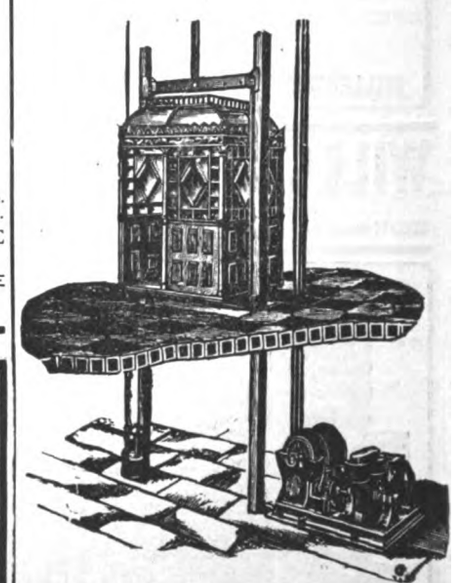
RECENT TESTIMONIAL.

[Copy] 46 Newcastle St., London, E. June 8, 1909.



GENTLEMEN,—You will no doubt be pleased to hear that the "Sine Qua Non" Range we recently had from you is giving every satisfaction; we understand that the amount of coal consumed is practically one half of what the old range consumed.

We are, Gentlemen, yours faithfully,
(Signed for A. EATON & Co., LTD.,)

BUILDING AND BUILDERS.

THE estimated value of the buildings for which warrants were granted by Greenock Dean of Guild Court for the year ended October 28, 1909, is 91,450*l.*, which is an increase of 28,005*l.* over last year.

THE improvements committee of the Derby Corporation have, after some weeks' consideration, passed the plans for a hippodrome to be erected at the corner of Green Lane and Macklin Street, Derby, and to accommodate 860 persons. The difficulty was the excessive height of the elevations compared to the width of the street. The architects are Messrs. Marshall & Tweedie, of Newcastle, and the cost is estimated at 15,000*l.* It is expected the work will not be commenced at once.

THE number of warrants granted by the Edinburgh Dean of Guild Court from November 1908 to October 1909 was 699. Although that total is seventy-three less than for the preceding year, the value of the buildings was 126,290*l.* more, the total being 569,670*l.* Mr. W. Allan Carter, C.E., 51 Queen Street, Edinburgh, has been elected Dean of the Guildry. The two other candidates withdrew.

THE Warwickshire County education committee has decided to erect another school at Bedworth, and a suitable site has been secured on the outskirts of the town, on the Nuneaton side. Exhall schools are to be enlarged at a cost of about 500*l.*, and several new class-rooms added to the existing school at Hartshill.

THE Reading Town Council have approved the preliminary plans prepared by the borough surveyor for an open-air swimming bath of concrete at Coley. The buildings, which are of brick, provide accommodation for attendant, washing house, cycle house and lavatory accommodation. The area of the land offered to the Corporation comprises about 3¼ acres, and the price to be paid is 950*l.* The cost is estimated to be as follows:—Constructing the bath, 1,670*l.*; buildings, platforms, foot-bridges, roads and other works, 1,650*l.*; land (950*l.*) and expenses (say 50*l.*), 1,000*l.*; total, 4,320*l.* The borough surveyor is to prepare detailed plans.

THE INSTITUTION OF MUNICIPAL ENGINEERS.

AT a meeting of the Council of the Institution held last week fourteen applications for membership and seven for studentship were considered. Of the former twelve were accepted, of the latter seven. The roll of the Institution is now: Members 630, students 89; total 719.

Associate Membership Class.—It was considered advisable that a class of associate members should be attached to the Institution, such associate members to be entitled to the privilege of corporate membership, and it was suggested that the following should be the clause in the by-laws in respect thereto:—

Associate Members.—A candidate for election or transfer to the class of associate member must produce evidence to the satisfaction of the Council:—(1) That he (*a*) has received a good general and scientific education; (*b*) has been regularly trained in those branches of engineering comprised within the duties of a municipal engineer; and (*c*) has had subsequent employment in the service of any municipal authority of which one year at least has been spent in an important position of responsibility in the direction or design of municipal work; or (2) (*d*) has had such experience in the design or execution of important engineering work for any muncipal authority as to qualify him in the opinion of the Council for the distinction of associate membership. The opinions of members on the proposal, to be submitted before the next council meeting to be held November 27, are invited.

Honorary Librarian.—It was suggested that "The Council shall at their first meeting after the annual election have power to appoint an honorary librarian from among the members of the Institution, this official to be an *ex officio* member of the Council until the next annual election." The opinions of members are invited on this proposal also.

General Meeting and Social Evening.—It was decided that arrangements be made for a general meeting, followed by a social evening, to which latter ladies would be invited, to be held in December. A committee with power to act was appointed to arrange the details. Members who are willing to submit papers for reading at this or a subsequent meeting are particularly requested to communicate at once with the secretary.

Visit to Works.—The secretary was instructed to arrange for a visit to works for some day in November.

Joint Meeting of Council and Honorary Secretaries.—It was decided that the joint meeting of the Council and the honorary secretaries of the various district committees should be held on November 27, the day of the next council meeting.

Municipal Golf Tournament.—A letter was read from Mr. Charles Vawser, of St. Mark's Lodge, Woodville Road, New Barnet, with reference to a proposed municipal golf tournament. Members requiring particulars are requested to write to him.

Municipal Engineering Corps.—A letter was read from the honorary secretary of the Municipal Engineers' Imperial Defence Committee asking for the support of the Institution in the proposed scheme for the formation of a municipal engineering corps. The Council, while expressing their accordance with the general principles, resolved to defer consideration of the letter until their next meeting.

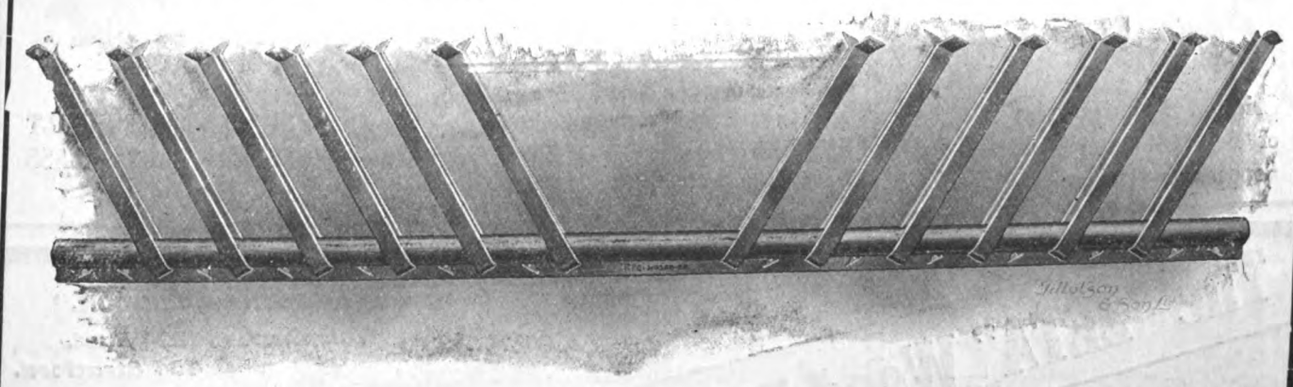
THE water-supply of Dunoon, N.B., is to be improved by the substitution of larger pipes at a cost of 3,500*l*.

ELECTRIC light is being introduced into St. Patrick's Cathedral, Dublin, by Messrs. Wm. Coates & Son, of Dublin and Belfast, under the direction of Sir Thomas Drew. The whole of the existing gas fittings are to be taken out. They will be replaced, as regards the nave, by three 50 candle-power lamps, placed in the middle of each of the three principal arches. The fittings will be of wrought iron. Each of the transepts will contain two similar fittings. At the crossing there will be on each of the four main columns eight 50 candle-power lamps. In the choir there will be clusters of three lamps at each of the four arches. The morning chapel will be lit with four clusters of three lights. The total candle-power available in the cathedral will be about 5,000. It is proposed to replace the existing five large hydraulic engines for the organ-blowing by electrically-driven rotary blowers. The Corporation electric supply is being used.

THE L.C.C. AND HOUSING.

THE following report of the Housing of the Working Classes Committee of the London County Council, relative to working-class dwellings demolished and built during the year 1908, was adopted at the meeting last week:—

We submit as a separate document a return which has been prepared showing the net addition to working-class accommodation provided in the county of London and in the adjacent districts during the year 1908. The returns for 1906, 1907 and 1908 deal with a larger area than the returns prepared for previous years, thirteen additional urban districts having been included of which the principal are Barking Town, Enfield, Hanwell, Heston and Isleworth, Ilford, Southall-Norwood and Southgate. The return also shows the number of rooms and tenements contained in the houses, as well as the average weekly rents charged per tenement and per room.



The information relating to the county of London has been obtained by means of the provisional valuation lists of each parish, and the houses suitable for working-class accommodation have been ascertained by local investigation. As regards the extra-London districts, the town clerks of the boroughs and the clerks of the councils of the various urban and rural districts have either supplied statistics or given facilities for obtaining the necessary information.

The several parishes and metropolitan boroughs in London and the boroughs, parishes and urban districts outside have, for the purposes of the return, been grouped into five sections—(i.) western, (ii.) northern, (iii.) eastern, (iv.) south-eastern, (v.) south-western. Each section is sub-divided into three zones, which are shown on a map which accompanies the return. The central zone or area, where very few new working-class dwellings are now being built, comprises the City of London, the City of Westminster, the Metropolitan Boroughs of Holborn, Finsbury, Shoreditch, Bethnal Green, St. Marylebone, Stepney, Bermondsey, and Southwark, and the northern part of Lambeth and the southern part of St. Pancras. The next zone, where considerable working-class accommodation is still being provided, comprises the remainder of the county of London; while extra-London, where the greatest addition to the working-class accommodation is now taking place, comprises the

Digitized by Google

boroughs, urban districts and parishes in the immediate neighbourhood of the county of London.

The number of rooms provided and demolished in the course of the year may be summarised as follows:—

	Central Zone.	Rest of London.	Extra London.	Total Area.
Number of rooms provided ...	2,182	8,205	22,195	32,582
Number of rooms demolished ...	2,637	1,324	380	4,341
Net addition	−545	6,881	21,815	28,241

One common lodging-house containing fifty-two beds was demolished during the year. The net addition to the number of rooms in the whole area in the years 1906 and 1907 was 52,755 and 40,017 as compared with 28,241 in 1908. The figures show that the diminution in the rate at which working-class accommodation is increasing has become more marked during 1908, the net addition for the year, both in the county of London and in the extra-London districts, being less than any year since 1902, when this record was first obtained. In the county of London the net addition to the number of working-class rooms amounted to only 6,426 in 1908, as compared with 21,475 in 1903. In London north of the Thames only 382 rooms were added during 1908, for while a considerable amount of accommodation was provided in Fulham, Hammersmith and Holborn, this was to a great extent counterbalanced by demolitions in St. Marylebone, St. Pancras and Stepney. South of the river a considerable amount of building is still proceeding in the outlying districts of Wandsworth, Lewisham, Greenwich and Woolwich. No dwellings for the working classes were provided during the year in the City of London or in the metropolitan boroughs of Hampstead, Paddington and Stoke Newington. Of the 32,582 rooms provided during the year 858 have been provided by the Council and 216 by other local authorities. Comparing the figures for the smaller area dealt with in the earlier years, the most striking feature is the falling off in the accommodation provided in the eastern and south-eastern sections. In the eastern section the number of rooms provided in 1908 was only 4,875, as compared with 15,716 in 1902, while in the south-eastern section 3,820 rooms were provided in 1908 and 8,627 in 1902.

The extent to which the new accommodation for the working classes has sufficed to meet the increase in the working-class population is a matter which cannot be ascertained with any great degree of accuracy. The number of persons which the new houses will accommodate may be estimated on a basis of an average of 1½ persons per room in London, and an average of 1¼ persons per room in the extra-London area. If this basis be adopted it may be stated that in the whole area accommodation for 36,856 persons has been added in the course of the year. The increase in population during the year, taking the Registrar-General's estimate for the County of London, and estimating the increase in the extra-London districts on the basis of the census figures for the period 1891-1901, would amount to 105,424. On the assumption that the increase in the working-class population amounted to two-thirds of the total, such increase would be 70,283 persons, as compared with 36,856 persons, for whom housing accommodation was provided, as estimated above. In previous years, however, there was a considerable surplus of accommodation provided, and the figures for the period from 1902 to 1908 inclusive, worked on a similar basis, indicate a total deficiency of working-class accommodation for 8,945 persons. In considering whether the number of working-class houses is adequate to provide for the increase in population, it should be borne in mind that there is at the present time a large surplus of middle-class houses, many of which will doubtless in course of time be made available for occupation by persons of the working class.

The rents charged for the new accommodation indicate practically no change from the rents ruling in 1907. For the central area the average weekly rent per room is 3*s.* 1½*d.*, for the rest of London 2*s.* 7*d.*, and for the surrounding districts 2*s.* 2¼*d.*

Mr. William Ford Stanley, J.P., of Cumberlow, South Norwood, S.E., founder of the firm of Messrs. W. F. Stanley & Co., Ltd., scientific instrument makers, who gave to South Norwood a public hall and art gallery, and had during the last fifteen years allocated a sum representing 80,000*l.* for the provision of technical trade schools and for the furtherance of musical education, and who died on August 14, aged eighty-one years, left estate of the gross value of 58,905*l.* 18*s.* 4*d.*

THE WELL-KNOWN FRIEZE

ENTITLED

"THE CORN FIELD."

Opinions of the Press.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

1. Ploughing.
2. Harrowing.
3. Mowing.
4. Carting.
5. The Products of the Corn Field.

Total length of the Five Plates, Fourteen Feet Seven Inches by Fifteen Inches deep.

A splendid example of COLOUR-WORK in Permanent Ink Photo by M. PAUL ALBERT BAUDOIN.

In consequence of the almost daily demand for these plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing. Free by post, carefully packed inside patent roller.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable subsiance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

CRADLEY HEATH.—The Trustees of the United Methodist Church invite architects to submit designs on approval for Sunday school, with seating accommodation for about 1,000. For particulars apply to Mr. C. Clee, Cradley Heath, Staffs.

HERNE BAY.—Nov. 30.—The Urban District Council invite designs for a pavilion to be erected on the proposed pier extension at a cost of 4,000*l.* Premiums of 25 guineas and 10 guineas. Deposit 1*l.* 1*s.* Mr. Joseph Jubb, clerk, Town Hall, Herne Bay.

IRELAND.—Dec. 1.—The Tralee Urban District Council invite designs for a proposed Carnegie library and technical school, to cost not more than 4,500*l.* Premiums of 20*l.* and 10*l.* The Town Clerk, Tralee, Ireland.

LEEDS.—Dec. 18.—The education committee invite architects practising in Leeds to submit designs for proposed training college for teachers, Kirkstall Grange, Far Headingley. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed to assist the committee. Deposit 2*l.* 2*s.* Mr. James Graham, Secretary for Education, Education Department, Leeds.

MINEHEAD.—Dec. 11.—For a shelter with cloak-room and lavatories, on the beach at Minehead, Somerset, to cost not more than 3,000*l.* Deposit 5*s.* Premium 20*l.* The premiated plans to become the property of the Council; or, in event of the architect carrying out the work, the premium will merge in the commission. Mr. L. C. Webber-Incledon, clerk, 16 Park Street, Minehead, Somerset.

WALES.—Jan. 31.—The Council invite designs for a National Library at Cardiff. Three premiums are offered. Assessors, Sir Aston Webb, R.A., Mr. John J. Burnet, A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A. Deposit 2*l.* 2*s.* Apply to Dr. Wm. Evans Hoyle, Director of the Museums, City Hall, Cardiff.

WORKINGTON.—Nov. 30.—The Cumberland education committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the borough of Workington, Cumberland, for about 300 pupils of both sexes. Deposit 1*l.* 1*s.* Mr. C. Courtenay Hodgson, secretary, The Courts, Carlisle.

WILLINGDON, &C. (SUSSEX).—Nov. 20.—For all or any of the following works, for the East Sussex education committee, viz.: (1) Erection of a new school and master's house at Willingdon; (2) erection of a new school and master's house at Broad Oak, Heathfield; and (3) alterations to the girls' and infants' school, South Road, Newhaven. Send names and addresses to Mr. F. J. Ward, county surveyor, County Hall, Lewes.

WINCHESTER.—Nov. 17.—For erection of three shops in Jewry Street. Mr. J. Ashton Sawyer, chartered surveyor, 59 High Street, Winchester.

WINCHESTER.—Nov. 13.—For erection of a high school boarding house. Send names to Messrs. Colson & Nisbett, architects, 45 Jewry Street, Winchester.

WORKINGTON.—Nov. 20.—For the execution of the several works required in erection of an extension of the meter house at the Stainburn Reservoir. Mr. H. B. Williams, borough engineer and surveyor, Town Hall, Workington.

A SCHEME is being promoted by the Worksop Co-operative Society for the creation of a "garden city." A site of about six acres has been acquired on the east side of the town, a locality hitherto undeveloped, and there the society propose to erect nearly 100 houses in pairs.

A BUILDING scheme is in process at Gourock, in view of the coming of torpedo factory workers from Woolwich next year. Several acres have been taken off by a Greenock syndicate on the farm of Cove, overlooking Cardwell Road, and it is intended to erect fifteen large tenements.

A MASS meeting of auctioneers and estate agents and others interested in real property will be held at the Cannon Street Hotel, London, on Thursday, November 18, to protest against the land clauses in the Budget. It is expected that a similar meeting of builders' merchants will shortly follow.

THE Fylde Water Board have resolved that a Bill be promoted in the ensuing session of Parliament for the construction of a covered service reservoir, water tower, and other works on land at or near Warbreck Hill, Blackpool; a 24-inch main at Upper Rawcliffe-with-Tarnacre; an equilibrium basin in Barnace-with-Ronds; for stopping up or diverting roads and footpaths; the acquisition of lands; the construction of additional conduits or line of pipes, and other powers.

(Patent) "HESTIA" GRATES (Patent)

EFFICIENT :: ECONOMICAL :: INEXPENSIVE

Made in a variety of designs as Registers, Mantel Registers, or Interior Grates.

A CERTAIN CURE FOR SMOKY CHIMNEYS.

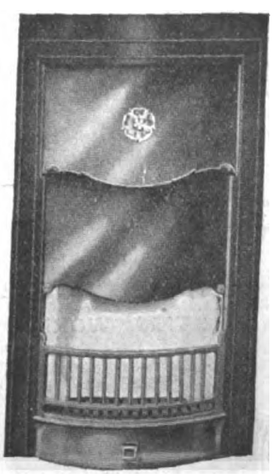
BURNS ANTHRACITE, COKE or COAL FUEL.

No. 2 Interior, with blower hidden behind the canopy.

SPECIAL FEATURES

SIMPLICITY.—No parts can get out of order. All parts can be removed and replaced by hand.

BLOWER hidden behind canopy always ready for use. Lowered and raised by slight hand pressure. No disturbance of the fire basket and no movement of the fire-bricks.



CHIMNEY DAMPER is automatic. Opening and closing with the pull and push of swing canopy, it checks down draught and prevents escape of warm air from the room.

THE "HESTIA" GRATES HOLD THE CERTIFICATE OF THE INCORPORATED INSTITUTE OF HYGIENE.

We Guarantee Satisfaction.

PLEASE WRITE FOR LISTS.

Williams	632 7 5
Rees	591 11 8

TRADE NOTES.

UNDER the direction of Mr. A. S. Manning, architect, Portland Chambers, Newmarket, the "Boyle" system of natural ventilation, embracing the latest patent "air-pump" ventilators, has been applied to Sir John Thursby's training establishment, Malton.

MESSRS. ARCHIBALD SMITH & STEVENS, lift engineers, Janus Works, Queen's Road, Battersea, have for family reasons converted their business into a limited company under the title of Smith, Major & Stevens, Ltd. No shares have been offered to the public, and the previous owners, Messrs. C. G. Major, E. C. Stevens and P. H. Stevens, together with Mr. P. C. Major, become directors, with Mr. C. G. Major as chairman.

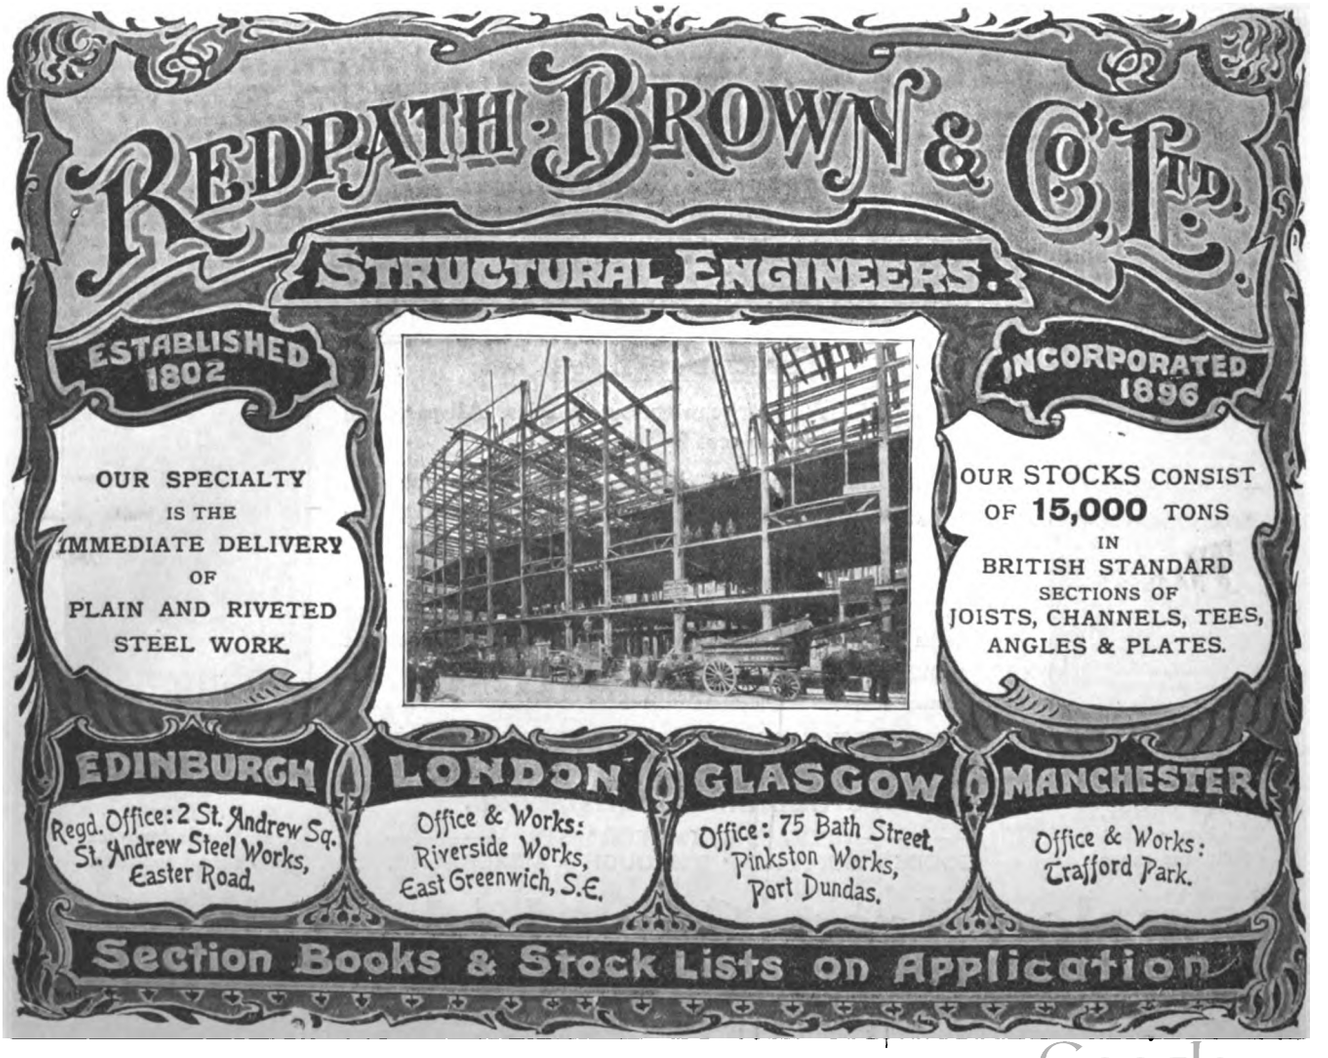
OWING to the great demand for the patent Manchester grate, stove, and ventilators, Messrs. E. H. Shorland & Brother, of Manchester, have been compelled to largely extend their works, and they have accordingly removed to new premises, viz., The Manchester Stove Works, Failsworth, Manchester. The change in address has necessitated alterations in their telegraphic address and telephone number, which now are:—Shorland, Failsworth, and No. 319 Failsworth, Manchester, respectively.

A MEETING for the purpose of forming the District Committee for District No. 4 of the Institution of Municipal Engineers (comprising the counties of Cambridge, Huntingdon, Norfolk, Northants, and Suffolk) will be held at the Royal Hotel, Norwich, on Saturday, November 13, at 2 o'clock.

BUILDING AND BUILDERS.

MESSRS. DOULTON & Co., the sanitary engineers, are carrying out an extension of their works at Hawkhead Road, Paisley, N.B.

THE Durham Urban District Council have passed amended plans submitted for a hippodrome to be erected at the corner of Providence Row.



THE West Riding Education Authority has, in consequence of the representations of the Mexborough Sub-Committee, decided to defer for six months the issue of advertisements for tenders with respect to the proposed elementary school in Adwick Road, Mexborough.

THE Glasgow Dean of Guild Court during the past official year dealt with 369 cases amounting to a total value of 902,613*l*. This is a slight increase on the amounts of two previous years, but is about half that averaged ten years ago when building trade was good.

PLANS are being prepared for the erection of new schools in connection with the parish church at Great Harwood to supplant premises in Queen Street which do not comply with the Board of Education requirements. The cost will be probably over 4,000*l*.

LOCAL masons and joiners have served notices on the Swansea Master Builders' Association for an increase of 1*d*. per hour, together with alterations of rules, the same to come into force in six months' time. The men are at present receiving 8½*d*. per hour. A provision in the rules stipulates that any dispute shall be settled by arbitration.

THE sixth Manchester Building and Sanitary Trades Exhibition will be held in the City Exhibition Hall, Manchester, from Tuesday, March 8, to Saturday, March 19, 1910, under the patronage of Manchester, Salford and District Building Trades Employers' Association, the Manchester and District branch of the National Registration of Plumbers, and the principal architects, surveyors and city and borough engineers of the North. A section will be devoted to the display of architectural drawings, plans and photographs. All inquiries to be addressed to Mr. Walter Cawood, Exhibition Offices, 16 John Dalton Street, Manchester.

VARIETIES.

THE Zoological Society are erecting new premises in their Gardens in Regent's Park according to the designs prepared by Mr. John Belcher, R.A. The cost will be over 15,000*l.*

HARLINGTON Baptist Church has been remodelled, renovated, and decorated under the superintendence of Messrs. George Baines & Son, 5 Clement's Inn, Strand. The contract has been carried out by Mr. T. W. Crutchfield, of Harlington.

DURING the year ending October 31 the Paisley Dean of Guild Court passed plans amounting to 90,260*l.*, which was an increase of nearly 5,000*l.* over the total for the preceding twelve months.

THE Pontypridd Guardians invite designs and tenders for erection of iron buildings in Court House Street, Pontypridd. A block plan of the site and of the size of the suggested buildings, together with a short description, may be seen at the office of Mr. Wm. Spickett, clerk, Union Offices, Pontypridd, at any time between 10 A.M. and 5 P.M., not later than November 23.

A REPORT on a scheme of water supply for Ecclefechan and district has been prepared by Messrs. D. Balfour & Son, of Newcastle-on-Tyne and Edinburgh, for the Lockerbie District Committee of the Dumfries County Council. The proposed source is from springs situate at Haregills at an altitude of about 500 feet, which yield a supply for the locality of over 60 gallons per head. It is proposed to construct a concrete reservoir near the springs, from which the water will be conveyed in pipes to Ecclefechan and also to all property situate in the large water district. The water will be delivered at a sufficient pressure to give ample head, except at three isolated properties, where tanks will be provided. There will be several miles of pipes to be laid, including the necessary stop, scour, and air valves, and also the providing of pillar wells for smaller property. The whole of the pipes are to be hydraulically tested in the trenches to double the working pressure before being covered up.

AT King's College, London, on the 5th inst., a number of master and operative plumbers attended from various parts of the country for practical and theoretical examination for the purpose of registration under the National Registration of Plumbers. The practical examination consisted of tests in lead bossing, also bending and wiping large and small joints as required for good class domestic sanitary plumbing. In the theoretical examination questions were put to the candidates dealing with domestic sanitation generally, ventilation, and the connection of water services to domestic dwellings and public institutions. Nine candidates passed, and were nominated to the General Council for registration under the National Registration of Plumbers and admission to the Register.

THE BUILDING OF A HOUSE.

AT the last meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society, Mr. James Flett, President, in the chair, Professor Charles Gourlay, B.Sc., A.R.I.B.A., delivered a lecture entitled, "The Building of a House." Beginning by defining building construction as the sum of all the building crafts controlled as regards design by the master mind of the architect, the Professor proceeded to treat his subject on the basis of this definition. He pointed out how fundamentally necessary it was that the student should study at least one entire building to enable him to appreciate the many varied processes which are involved in the construction of buildings. To emphasise this view he then showed a series of slides giving complete working drawings for a country house in which as many different constructional details had been included as possible, while maintaining the unity of the design as a whole.

In conclusion he urged the importance of all architectural craftsmen pursuing a general course of this nature in building construction.

A NEW ENLARGING INSTRUMENT.

THE "Best" enlarging and reducing scale has the advantages of simplicity and accuracy, and though not equal in rapidity to the pantograph, appears to us to be superior in accuracy. It consists of a stock or body, the centre of which is grooved to receive a movable slide, on which are engraved four scales, so that the same instrument can be used for various proportions of enlargement or reduction. At each end of the stock is a pivot plate and the instrument is used, as may be seen from the illustration, by placing a pin through the pivot-hole and revolving around this centre. The distance from the centre of points on the original plan is read on the edge of the stock, then the corresponding enlargement is taken on the central scale and the point marked by a pricker forming part of a sliding cursor. Thus points on the original A, B, C, D determine similar points on the enlargement. Ivory slips are carried by the cursor for subdivision of the parts on the principal scales. It will be seen that the idea of the instrument is based on the theory of similar triangles, and cannot fail to be accurate with careful handling.

HALF SIZE.

PLAN ENLARGED 2/1

1/6 ACTUAL SIZE.

RUBEROID
SYSTEM OF ROOFING

THE
RUBEROID
SYSTEM OF ROOFING
has stood the test of 17 years' actual use, and time has proved it the best, both on boards and concrete. RUBEROID is made in three colours: Grey, Red, and Green. It is suitable for the most permanent buildings, while its low cost makes it an economical covering for temporary structures.

ESTIMATION OF AREAS.

For the calculation of areas of land or other surfaces of an irregular form various instruments have been devised in the form of computing scales or planimeter. A new instrument which has the merit of simplicity is the "Areameter," made and sold by Mr. Albert E. Mallandain, of 51 Cheapside, London. This consists of a clear piece of celluloid, which has two curved and one straight edge. In the centre of the straight edge is a nick which enables the instrument to revolve around a centre pin placed approximately at the middle of the area to be computed. As the instrument revolves it marks on the periphery of the area the bases of triangles of equal area, so that one has only to count the number of divisions in the periphery of the area to obtain the number of equal triangles into which the area is divided. The only objection we have to the instrument is, that as ordinarily supplied the plan must be drawn to rather a small scale, but we presume it would be possible to have larger sizes of the instrument made to order on the same principle.

LONDON MASTER BUILDERS' ASSOCIATION.

A special Council Meeting was held at 31 and 32 Bedford Street, Strand, W.C., on Thursday, 4th inst., the President (Mr. F. G. Rice) in the chair.

The meeting was largely attended, and much interest was displayed in the various subjects submitted for consideration.

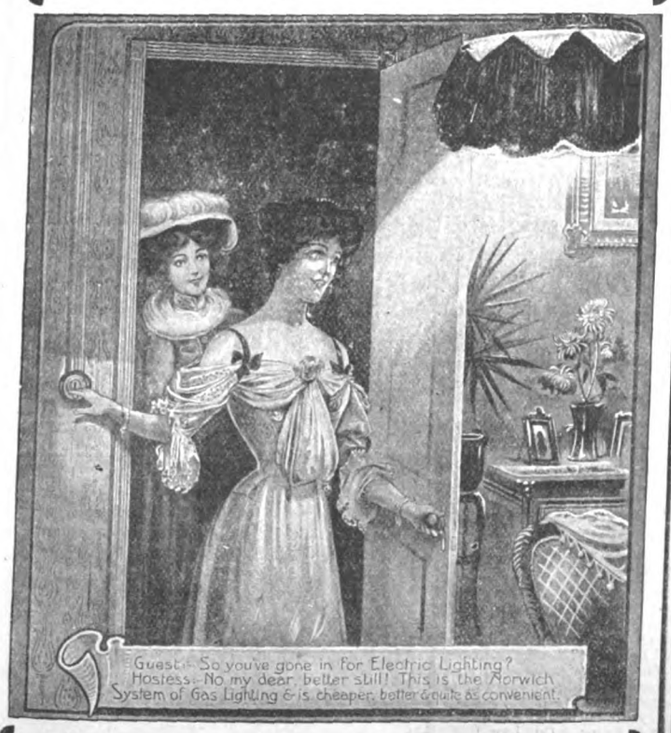
The "proofs" of the pamphlet about to be issued were considered, and instructions were given as to their circulation. A question arose as to the radii observed by the London County Council and the London Master Builders' Association; twenty miles from Charing Cross being adopted by the former body as its limit, while the latter body had a radius of twelve miles from the same centre, as set out in the working rule agreements with the different trade societies. Eventually the Council decided to adhere to its own limitations, and to limit its operations to the twelve-mile radius.

A very interesting discussion on the work of the Organisation Committee took place, in which Mr. F. Higgs (Chairman of that Committee), Mr. G. Bird Godson, Mr. Frank May, Mr. W. Lawrence, jun., Mr. John Garrett, Mr. Ernest J. Brown, and Mr. H. W. H. W. Horner took part.

Mr. G. Bird Godson referred to the question of tendering without quantities being supplied, and to the hardship imposed on builders by having to take out their own quantities He suggested that the matter be ventilated by deputations from the London Master Builders' Association to wait upon the Royal Institute of British Architects and other professional bodies concerned.

Mr. Ernest J. Brown gave the views of the National Federation, and said it was a matter which every effort would be made to remedy.

The Council fully sympathised with Mr. Godson's views, and determined to ask the Royal Institute of British Architects and other bodies to receive a deputation.



The resolutions passed at the conference with the Quantity Surveyors' Association on October 13 last had been sent to the members of the Council, and it was resolved to send the following to each member of the association. The discussion on it was entered into by Mr. Ernest J. Brown, Mr. Frank May, Mr. W. F. Wallis, and others, and it was

Resolved: That the Conference disapproves of the practice of asking for tenders in competition for works of a substantial value without quantities, prepared by a fully qualified quantity surveyor, being supplied, and is of opinion that such quantities should be supplied in all cases when competitive estimates are invited for works expected to cost 500*l.* and upwards.

A letter advocating the preferential employment of registered plumbers was read, and the views entertained and expressed upon much the same subject by the Institute of Builders were given. The Council was of opinion that the persons engaged should be judged by their practical, and not by paper, qualifications.

Messrs. D. Burkle & Son, of 34 Osnaburgh Road, N.W., was elected a member of the association on the nomination of Messrs. H. C. Cleaver, Ltd., seconded by Mr. G. Bird Godson.

THE "BELL" BOILER.

THE Bell Range and Foundry Company, Ltd., having come to the conclusion that the kitchen range boiler altogether failed for the purposes of domestic hot-water supply, set about the production of a substitute. There are many types of independent boilers, but the latest, the "Bell" boiler, is a departure from these. It is a new application of a familiar principle, as will be readily seen by the section here given. In the old boilers as in the old fire-grates an

almost incredible amount of heat rushed straight up the chimney and was lost. In their new type all this vertical heat is trapped by the back being made diagonal from the top to the base, so that every part of the fire is directly under the water. The boiler is made of wrought-iron $\frac{3}{8}$-inch plate, with a waterway all round the four sides, and it stands on an iron base. In No. 1 type there is a separate iron casing for the front and top, which thus leaves the sides and back exposed for pipe connection and for cleaning. It has a capacity of 100 gallons per hour at 212°, and the fuel may be anthracite, coke, or coal-cellar sweepings. "Bell" boilers may be utilised for heating and hot-water supply combined. The heating of the radiators is direct from the boiler, and the heating of the domestic supply is by means of a coil in the cylinder, the coil being heated direct from the boiler.

A No. 1 boiler may be used for two radiators each of 30 to 40 feet heating surface, according to distance from the boiler, and in addition will supply hot water at 200° at the rate of 50 to 100 gallons per hour, according to the stoking. This is an ample supply for houses having one or two baths and three or four additional hot-water taps to lavatories, &c.

A No. 2 boiler, which has double the capacity of No. 1, will supply six radiators in addition to domestic supply as above, or with fewer radiators a proportionate extra supply of hot water.

In the second type the boiler is fitted with a tile surround and an iron mantelpiece so as to make it suitable for a kitchen or living room where it is desired to see the fire. The capacity for water heating is 75 gallons per hour, as against 100 gallons in the other, which is an ample supply for a house with one bath and four hot-water taps. The "Bell" boiler, it will thus be obvious, is a noteworthy addition to hot-water engineering appliances, and it is based on elementary scientific principles.

THE East Street Baptist Church and Schools at Southampton are designed in Late Gothic, freely treated. Externally the facings are of red bricks with Bath stone dressings. The complete scheme embraces church with lofty tower, seniors' school, intermediates' school, and juniors' school. The latter section of the school is to be omitted for the present. The cost of the portion to be executed at the present time is about 6,000*l*. The architects, whose designs were selected in a recent competition, are Messrs. George Baines & Son, 5 Clement's Inn, Strand, London.

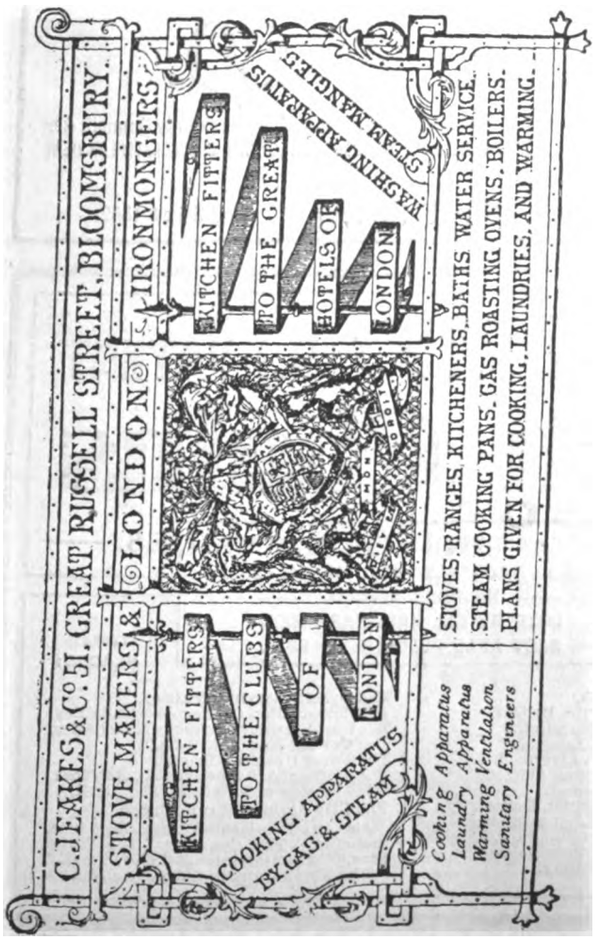
WAYGOOD CRANES AND HOISTS.

At the north-east end of London Bridge there is always a large number of people who crowd to the parapets in order to watch the unloading that is unceasingly in progress at the wharfs below. There seems to be an irresistible fascination in the sight of the closely-packed steamers and barges, in the continuous chain of men carrying bales and boxes, and above all in the wonderful cranes that seem to be possessed of more than human dexterity in transferring enormous loads between the vessels' holds and the attendant lighters or warehouses. Probably very few of these idle spectators bother their minds as to the mechanism required to operate such machinery. Such problems only occur to the busy passer-by who lacks the leisure to stop long enough to find out. To such a person the last list issued by Messrs. Waygood & Co., Ltd., dealing with "Cranes and Hoists worked by Hydraulic and Electric Power," cannot fail to be of interest. The firm have for some years past been making a very special study of large cranes for such work, and have erected a very large number of them. One of the illustrations shows an hydraulic wharf crane with patent luffing jib fitted at Gun and Shot Wharf, and another is of a similar crane fixed at Hope Wharf, Rotherhithe. In the first the wrought-iron jibs can be made to luff from 60 feet maximum to 27 feet minimum. Messrs. Waygood are not, of course, committed to the exclusive use of either hydraulic or electric power. The providers of both now offer facilities for its employment. The London Hydraulic Power Company have extended their high-pressure supply on both sides of the Thames, and the electric supply companies usually provide continuous current at low rates.

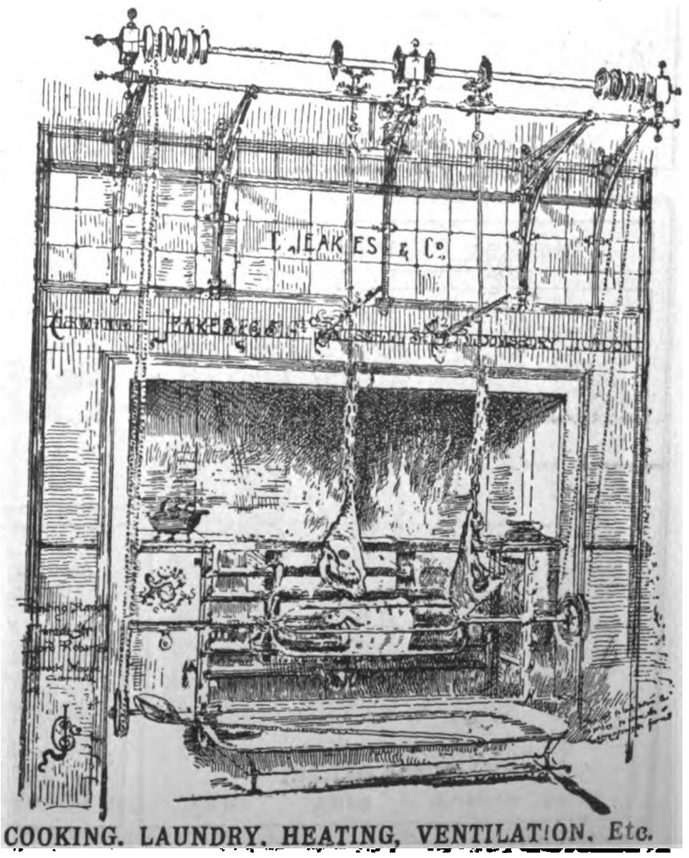
The list is not confined to riverside machinery, for it also deals with the firm's hydraulic warehouse crane, of which a very large number have been fixed all over the country. In some cases as many as eight are installed in a single warehouse. There are, in addition, illustrations of an electric warehouse crane, an electric gantry crane at work on Tower Bridge Wharf, an hydraulic pedestal crane fixed at Fishmongers' Hall Wharf, a friction hoist, and a hand-power crane. Messrs. Waygood's lifts have received the *imprimatur* of royalty, and it is evident that their cranes and hoists equally maintain their reputation.

HOT-WATER SUPPLY SERVICE INSTALLATIONS.



In the heating and domestic engineering trade disputes have been caused within the last few years in some districts by the aggressive action of the plumbers in claiming a monopoly of pipe-fitting and fixing work in all metals (whether lead or not) to the exclusion of any other trade. With the object of preventing such disputes the engineers have all along been willing to submit the whole matter to arbitration for a general, national settlement.

A step in this direction has now been taken in connection with a dispute on the new Masonic Hall, Leicester, where the plumbers, in pursuance of their claims, adopted their usual policy of "sticking the job." Lead work is not in dispute, as it is not touched by the engineers. After protracted delay the plumbers agreed to join in an application to the Board of Trade to appoint an arbitrator to hear and determine the question of dispute between the parties. Alderman T. Smith, J.P., was appointed to act as arbitrator, and heard the case in Leicester on the 5th and 6th inst., the parties represented being Messrs. Ashwell & Nesbit, Ltd., the heating and domestic engineering contractors; the Masters' National Association and the Operatives' National Union connected with this trade on one side, and the plumbers' section of the Leicester and District Building Trades Employers' Association and the United Operative Plumbers' Association (Leicester District) on the other side.



At the termination of the proceedings the arbitrator reserved his award, but it is expected to be given immediately.

A fishing village is proposed to be constructed in Cardigan Bay at a cost of about 40,000*l*. The scheme is connected with the Welsh Industries Company, Ltd.

The Samuel King's secondary school at Alston, Cumberland, was opened recently. The block, of stone from Nattrass Gill, with worked stone from Prudham Quarry, and Haltwhistle bricks, faces the town. There is a large central hall, from which run corridors through the sections for boys and girls. The cost was about 3,700*l*. The architect was Mr. T. Taylor Scott, architect, Carlisle.

MR. BAINES, of High Street, Bedford, and Mr. M. C. Hart, of Castle Road, Bedford, have jointly purchased nine and a half acres of the Putnie Park, Bedford, for the purpose of developing it as a building estate.

THE Alliance Insurance Company are erecting an important block of offices at the corner of Mosley Street and Pilgrim Street, Newcastle. There are four storeys and a lower ground floor. The entrance hall is spacious and elaborately decorated, with an electric passenger lift. The architects are Messrs. Newcombe & Newcombe.

ORIENTAL SANITARY ENGINEERING.*

BROADLY speaking, engineering in the Orient does not differ from that obtaining in the West when carried out by Europeans. Hence I would prefer this paper to be considered as one on Oriental sanitation, under which heading I will touch upon a few points in sanitary engineering from a municipal engineer's point of view.

Roads.—All the best recognised principles in Great Britain are to-day practised in the East. It is desirable, however, to remember that the amount of "binding" material required is to an extent dependent on the rainfall: more such material being necessary to prevent the road disintegrating in parts of the country having long dry seasons than in those having more frequent rain. The same consideration affects the camber of the road; places subjected to very heavy falls of tropical rain should have roads as flat as possible, otherwise they are cut up into ruts.

Road Watering.—This is of great sanitary importance in hot countries, as besides its protective influence on the road, it prevents the distribution through the wind of decaying refuse. The native overseers, however, unless well supervised, will have the roads watered whilst the sun is still blazing, and by the time people turn out in the evening the roads are dry. The installation of a water supply such as Calcutta is using for watering streets is inadvisable. The water is pumped from the river Hooghly—notoriously dirty—direct into distributing mains, and delivered at high pressure through hydrants and hose on to the roads. The consequence is that, with the water, a very large amount of matter in suspension is distributed, which makes its presence appreciably felt as soon as the roads are dry again. A good deal of this matter must settle on comestibles exposed for sale. The grit, &c., in the water is also the cause of most of the hydrants being in a state of chronic leakiness.

Drainage.—In the majority of rural districts, and in the most thickly populated but poorer parts of many large towns, there are no sanitary conveniences worthy of the name in or

* Abstract from paper read at a Sessional Meeting of the Institute of Sanitary Engineers on November 3 by C. T. Evennette (Fellow).

SEE THAT THE NAME YALE IS ON THE LOCK.

"YALE" Locks are exclusively fitted in the following places amongst others—
Midland Hotel, Manchester.
Savoy Hotel, London.
Ritz Hotel, London.
"Morning Post," London.
Oceanic House, Cockspur St., W.
Fifty-eight Tube Stations, London.
Liverpool Cotton Exchange.
Messrs. Carr & Co., Ltd., —Offices and Works, Carlisle.
Westinghouse Co.'s Works and —Offices, Trafford Park.
Messrs. Vickers, Son & Maxim. —Ltd., &c.

That is important! for no other Locks possess the Security, Convenience, and the possibility of Master Keying, as all Locks, such as Door Locks, Drawer and Cupboard Locks, Padlocks, and in fact every Lock in a Building can be opened by one Master Key. ¶ The No. 640 "YALE" HORIZONTAL MORTISE KNOB LOCK ensures security with the convenience of a small "Yale" Key possessing unlimited key changes. ¶ Fitted throughout Lancaster Town Hall, Messrs. Selfridge's, Oxford St., W., &c., &c.

The Yale & Towne Company,
6 City Road, Finsbury Square, London, E.C.

at all near blocks of houses. In most houses, however, there is a squatting place in the house, or in the corner of a small attached courtyard, from which sullage water often drains into the public roadside drains—where such exist—outside the houses. Often such roadside drains are earthen, and the result can easily be imagined. A municipal engineer, when required to pave such drains in towns having no pipe-water supply, or an insufficient supply of water to allow of a system of sewers being laid down, must take into consideration several points peculiar to such situations. Since all surface drainage water contains a large amount of matter in suspension, it is desirable that the liquid flow as quickly as is compatible with the safety of the material of which the drains are constructed. During the dry season there will be only sullage and a small amount of domestic water to be dealt with; whilst in the rainy season the quantity of water is great. The difficulty is to have such a section of drain as will give a sufficient velocity in the dry season and still be serviceable during the rains. The saucer-shaped drain is cheap and easy to lay, and, superficially, the easiest to keep clean by manual labour. It is, however, almost the worst shape to put down, as during the hot season the very small amount of water (and that largely sullage) which flows, spreads out with very little flow, and also forms a film on the sides of the wide drain from which gases of decomposition quickly emanate. Any form of drain having angles or a flat bottom is equally objectionable, as the former are very difficult to keep clean, and the latter are not self-cleansing. In fact, this last is worse than the saucer shape.

The best form is what is sometimes called the peg-top section. This has an invert of about 135 deg., with a small radius, and straight sides above it tangential to the ends of the curve. According to the amount of water required to be dealt with suitable dimensions for all seasons can easily be arranged.

Covered-in drains, as distinct from a sewerage system, are an abomination in the East, as they are almost impossible to keep clean. A compromise can be arranged, however when necessary, by having removable covers to the pattern of drain last described (*i.e.* the peg-top). These covers should be made in short lengths, so that they can be lifted to allow of thorough cleaning of the drain.

The sullage usually finds its way to the end of the line of masonry drains, only to flow into earthen drains at the end. The reason is often an insufficiency of public funds to continue the line of masonry drains right outside the township, and there to dispose of it scientifically. When drains empty themselves thus, there is generally a black quagmire for some distance along the earthen line of drainage—and that is all—until possibly some deadly disease breaks out, and then matters are carried further if funds can be made available.

These evils can be mitigated with very little cost until further funds are at his command by the construction of a small masonry tank 4 or 5 feet deep at the end of the line of masonry drains and at a slightly lower level. This tank should be divided into two compartments by a partition wall—the compartment nearer the end of the drain should be about a third of the size of the other. Holes should be left at the bottom of the partition wall, and an iron grating fitted just below the outfall of the drain into the first compartment. A grillage should be fitted across the larger compartment about a foot from the floor, above which grillage cinders, broken brick, or stone should be put in, gradually diminishing in size up to the top. By upward filtration of the liquid discharged from the drainage line in this manner a great nuisance and danger to health is thus minimised, as the effluent can then be safely left to meander along the earthen drainage line beyond such a filter.

If the amount of sullage from the masonry drains is very small, it would be sufficient perhaps to excavate a length of about 20 feet or so, to a depth of 2 feet of the earthen drain, commencing at the end of the line of masonry drains, and to fill this excavation with suitable available metal.

Flushing of Surface Drains where no Pipe-water Supply Exists.—Generally, wells are found on the roadsides, and to take fullest advantage of the water so situated the sides of the walls of the drains should be grooved every 150 feet or so for the purpose of boards being fitted into the grooves across the drain section. One section is then filled with water from the well and, as soon as the board is withdrawn, if a sweeper starts from the head of the section, and uses his broom properly, the velocity of the water going forward to the next section is much increased, and the drain is efficiently cleansed at the same time.

(*To be continued.*)

NOW READY,

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says :—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest."

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

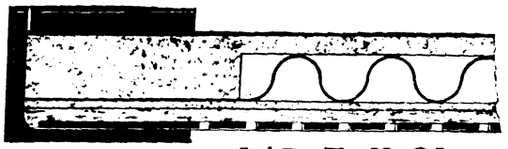
"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist, however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately, there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."



May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

TRADE T T MARK

¶ FIRECLAY is the finest material in which Baths, Sinks, Urinals, and all large pieces of Sanitary Ware can be made, providing it possesses a non-absorbent enamelled surface of the requisite hardness and durability.

¶ This result can only be obtained by firing the ware to an extremely high temperature, as in the case of TWYFORDS' "ADAMANT" FIRECLAY.

¶ Inferior fireclay goods, fired at comparatively low temperatures in order to reduce cost of production, are neither sanitary nor durable, although often of excellent appearance when new.

Catalogues, and sample of "Adamant" Fireclay for testing purposes, free on application.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

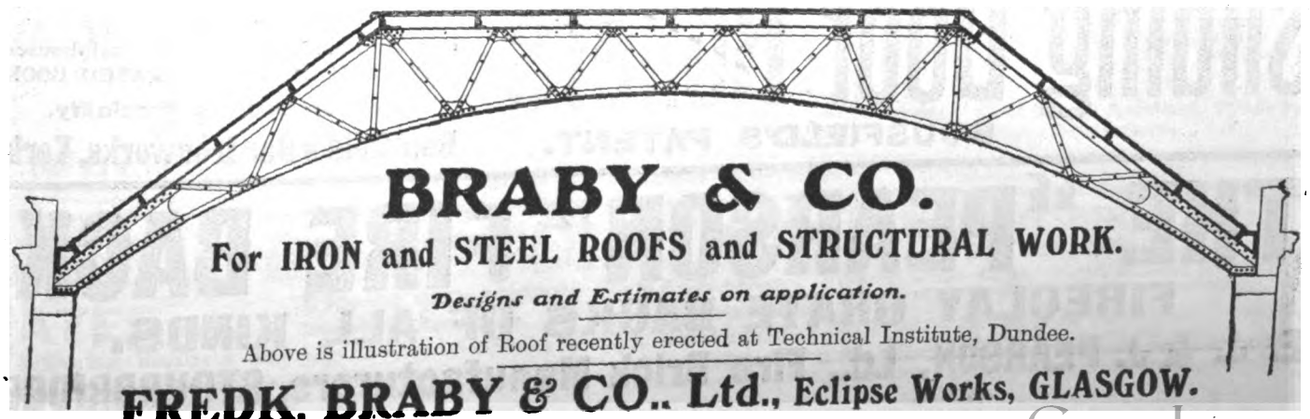
**** As great disappointment is frequently expressed at the appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

HERNE BAY.—Nov. 30.—The Urban District Council invite designs for a pavilion to be erected on the proposed pier extension at a cost of 4,000*l.* Premiums of 25 guineas and 10 guineas. Deposit 1*l.* 1*s.* Mr. Joseph Jubb, clerk, Town Hall, Herne Bay.

IRELAND.—Dec. 1.—The Tralee Urban District Council invite designs for a proposed Carnegie library and technical school, to cost not more than 4,500*l.* Premiums of 20*l.* and 10*l.* The Town Clerk, Tralee, Ireland.

LEAMINGTON.—Dec. 3.—The Council offer a prize of 10*l.* for the best design for an extension of the cooling-room at the pump-room and baths. Mr. Leo Rawlinson, town clerk, Leamington, Warwickshire.



LEEDS.—Dec. 18.—The education committee invite architects practising in Leeds to submit designs for proposed training college for teachers, Kirkstall Grange, Far Headingley. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed to assist the committee. Deposit 2*l.* 2*s.* Mr. James Graham, Secretary for Education, Education Department, Leeds.

MINEHEAD.—Dec. 11.—For a shelter with cloak-room and lavatories, on the beach at Minehead, Somerset, to cost not more than 3,000*l.* Deposit 5*s.* Premium 20*l.* The premiated plans to become the property of the Council; or, in event of the architect carrying out the work, the premium will merge in the commission. Mr. L. C. Webber-Incledon, clerk, 16 Park Street, Minehead, Somerset.

OLDHAM.—Feb. 1. The Town Council invite competitive designs from architects practising or residing within the borough for an extension of the town hall. Premiums of 50*l.*, 30*l.*, and 20*l.* are offered, together with 5*l.* for every competitor who carries out the instructions. Apply to Mr. E. C. Foote, borough surveyor, Oldham, Lancs.

WALES.—Jan. 31.—The Council invite designs for a National Library at Cardiff. Three premiums are offered. Assessors, Sir Aston Webb, R.A., Mr. John J. Burnet, A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A. Deposit 2*l.* 2*s.* Apply to Dr. Wm. Evans Hoyle, Director of the Museums, City Hall, Cardiff.

WORKINGTON.—Nov. 30.—The Cumberland education committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the borough of Workington, Cumberland, for about 300 pupils of both sexes. Deposit 1*l.* 1*s.* Mr. C. Courtenay Hodgson, secretary, The Courts, Carlisle.

Digitized by Google

CONTRACT OPEN.

ALDEBURGH.—Nov. 24.—For the removal of the upper portion of the existing brick water tower at Aldeburgh, including the roof, cast-iron tank holding 11,000 gallons, girders and internal fittings, and the construction of a new steel tank to contain 35,000 gallons upon steel columns and joists fixed inside the tower, and rebuilding the walls of the tower to a greater height, together with the connections to the mains, staircases, and other works, for the Corporation. Deposit 2*l.* 2*s.* Messrs. J. Mansergh & Sons, engineers, 5 Victoria Street, Westminster.

BARNET.—Nov. 22.—For the alteration of external doors, &c., at the isolation hospital. Messrs. White, Son & Pill, 13 and 15 High Street, Barnet.

WINDSOR.—Nov. 22.—For alterations at the Corn Exchange, Guildhall, Windsor. Mr. E. A. Stickland, borough surveyor, 16 Alma Road, Windsor.

WORKINGTON.—Nov. 20.—For the execution of the several works required in erection of an extension of the meter house at the Stainburn reservoir. Mr. H. B. Williams, borough engineer and surveyor, Town Hall, Workington.

WREXHAM.—Nov. 23.—For the following works at Alexandra schools, or any of them, for the Corporation. (1) Building of palisade wall along Holt Road; (2) supplying wrought-iron railings for palisade; (3) supplying and fixing unclimbable iron fencing. Send names to Mr. Lawson Taylor, clerk to the education committee, Guildhall, Wrexham.

YARDLEY.—Nov. 29.—For works of drainage, excavation, levelling, construction of paths, pool lavatories, and boundary walls, &c., at the Sparkhill recreation ground. Deposit 3*l.* 3*s.* Mr. A. W. Smith, engineer and surveyor, Council House, Sparkill, near Birmingham.

MR. A. ROBERTSON, architect, Inverkeithing, N.B., has been instructed by the local School Board to prepare plans for a school to accommodate 900 children.

THE Stoke-on-Trent Board of Guardians have instructed their architect to prepare plans for new union offices, to cost about 5,000*l.*

A TOWN'S meeting, convened by the Mayor upon a requisition of ratepayers, was held at Burslem last week, to protest against the proposal of the Town Council to erect new municipal buildings, at an estimated cost of 30,000*l.*, towards which it is said there is a sum of 16,000*l.* in hand. By a very large majority a resolution was carried protesting against the proposed expenditure, and asking the Town Council to take the necessary steps to prevent the scheme being proceeded with, and to take a poll. Tenders for the work have already been advertised for.

THE Glasgow Alhambra, Ltd., are about to erect a new variety theatre in that town. A central site at the junction of Waterloo Street and Wellington Street—at present occupied by the Waterloo room—has been secured, and the intention is to demolish the existing structure and erect a building which will provide sitting accommodation for 2,500 persons and standing room for other 300. The building will be fitted up in the most up-to-date style, and the cost is not expected to exceed 27,500*l.*

NEW CATALOGUES.

THE Meadow Foundry Co., Ltd., have prepared for the use of civil and sanitary engineers, surveyors, and contractors a catalogue of their sewerage, sanitary and municipal ironwork and appliances. Among them is an improved slag-heating furnace for making tarred macadam, and a patent smokeless furnace, as well as indispensable things like gulley grates, ventilating shafts, valves, and street lamps. Special attention is drawn to the "Mansfield" improved ash or dust shoot, as being the only silent and complete shut-off and dust-proof shoot on the market, and as especially suitable for flats and other large buildings where the architect requires something more satisfactory and sanitary than the cheap and common form of shoot.

THE catalogue of Messrs. J. Carter, Sons & Co., Ltd., Manchester, indicates the extraordinary variety of tools that are now required in mechanical engineering. As the company was established ninety years ago, it would be interesting to discover how many of the prodigious number of tools illustrated and priced in their latest lists were known in the first quarter of last century. Many of the trades now catered for were then unknown. The very comprehensive list ranges from pliers to screwing machines, or cranes and travellers.

ALTHOUGH scarcely two years have elapsed since the "Margewood" locks were introduced into an already well-stocked market they are now recognised as an almost perfect lever lock. The reason for their success is, that at the very point where all ordinary lever locks were weak the Margewood patent is especially strong. The two main mechanical improvements are (1) that the bolt and levers are pivoted together instead of being separate working parts, and (2) the lever stump is rigid with a double bearing or support in the lock-plate instead of being weak through its single bearing. As a consequence the lock becomes both stronger and simpler, for the bolt cannot be forced without shearing the rigid lever stump and the parts cannot get out of position. The Margewood Locks, Ltd., 11 Clerkenwell Green, E.C., in their latest catalogue illustrate the many varieties of their cabinet and building lever locks, in all of which the same principle is embodied. The locks are almost a revolution in the accepted methods of lock manufacture, and have attracted very general

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the SCAGLIOLA can afterwards be fixed round WITHOUT SHOWING JOINT.

Prize Medals, 1851 & 1862.

A DECORATIVE MATERIAL of the RENAISSANCE WHICH HAS STOOD THE TEST OF CENTURIES.

COLUMNS,
PILASTERS,
WALL-LINING, DADOS,
and all forms of INTERNAL DECORATION.

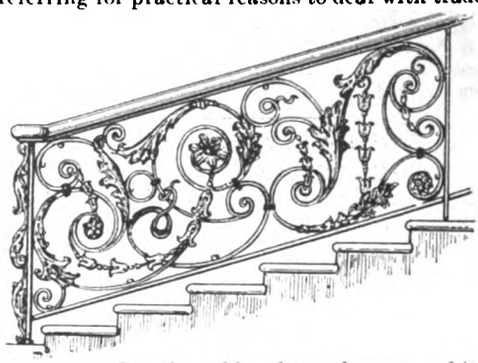
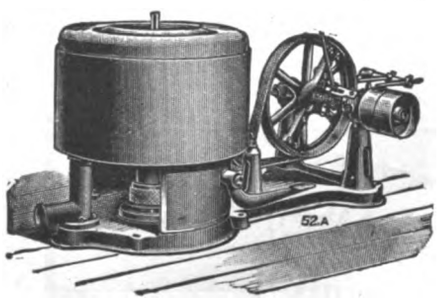
attention and admiration, and will shortly be placed upon the market.



PHILLIPS'S "Monthly Machinery Register," Newport, Mon., has been in existence for no less than thirty-six years. The issue for November contains nearly 130 pages exclusive of the monthly electric machinery, motor-car, and steam wagon supplement. The tariff for displayed advertisements, as well as the prices for entries of new and second-hand machinery for sale, are most moderate. As a consequence an enormous number of the latter are to be found; indeed the total value of the machinery and plant for sale and hire is estimated at 260,000*l*. The publication is of a kind that is kept for reference, and therefore should prove an effective medium for advertisements.

SOMETHING more than a catalogue is the handbook entitled "A Few Suggestions for Ornamental Decoration," of which the second edition is now published by Messrs. Thomas Parsons & Sons, for whilst it tells us of the varnishes and paints now supplied by this long-established firm of manufacturers, it contains a large number of very admirable suggestions in decorative design based upon the work of all periods from Pompeian to l'Art Nouveau, besides many that have the merit of so much originality as to be unassignable to any precise historical period. There are some designs that do not suit our personal taste, but one must recognise that a firm like Messrs. Parsons has to cater for a variety of tastes. Though there are many examples in the book that might be copied straight away, and full permission is given for doing so, the effect upon ourselves is rather that of a stimulant, and when we look through the pages we feel impelled to sit down and make a design of our own. In this way, we take it, the book fulfils its object of offering suggestions. Many of the illustrations are printed in colours, and some of them are quite delightful.

THE Clyde Structural Iron Company, Ltd., are evidently not content with their English and Scottish successes in the execution of difficult work, for their latest catalogue includes photographs of jobs received from Austria, Rangoon, Australia, Ireland and Spain. The firm give special attention to orders received from abroad, and keep a staff for the preparation of designs and drawings to facilitate the work of re-erection after being fitted in their shops at Scotsoun, which are near Glasgow, and in direct communication with the leading railways. But the bulk of the photographs show contracts in hand and complete in Great Britain. These are of many varieties, including railway roofing, electric car-sheds (as at Heaton, where the dimensions are 520 feet long by 180 feet wide in four spans), machine and other engineering shops, brass foundry, tube works, electric power stations at Rangoon, Dundee, Spennymoor, a drill hall at Leith, grand stands at Newcastle, Twickenham, Fulham, Chelsea and Kilmarnock, several railway foot-bridges, steel hoppers and roofs. The catalogue concludes with some thirty sketches of the kinds of work the firm undertake, and it is stated that they are ready to prepare special drawings and submit estimates free of charge, or to send a representative. The Clyde Structural Iron Company, Ltd., are happy in the possession of a high reputation, which has spread to many parts of the globe, as well as all over this country.



TRADE NOTES.

AN expression of regret is sometimes heard that architects too rarely entrust the metalwork of their buildings to craftsmen, preferring for practical reasons to deal with trade firms.

It is unfortunate that the golden days when an architect was surrounded by a troop of earnest craftsmen all working in concert seem to have vanished beyond recall. It is now wisest, while accepting the situation philosophically, to devise some method of improving the results

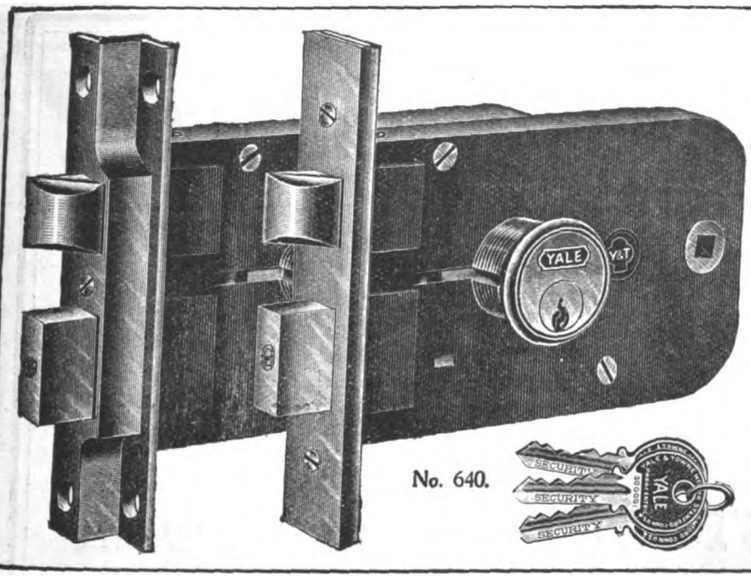
obtained by the existing system of trading specialists. There is no need to despair, for (as will be seen by the accompanying illustrations) the work achieved by them is sometimes of no mean order. The larger block shows a lift-cage erected in the Houses of Parliament, which

was made by Messrs. Witchell & Co., whose works are at Brockley, S.E. It would be difficult to improve upon the design, which most happily combines strength and Gothic elegance. The other block shows a staircase balustrade made by the same firm of art craftsmen, which is most suitable for its purpose.



Messrs. Patman & Fotheringham, builders and contractors, 1 Theobald's Road, W.C., have been successful in obtaining the contract for the alteration and reconstruction of No. 2 Seamore Place, Park Lane, W., under Mr. W. H. Romaine Walker, the architect.

Mr. Lewis J. N. Gorton, 40 William Edward Street, Birmingham, has just fully patented a "cleaning" casement, the "Exclusive." It is controlled by two radial arms, one at the top and the other at the bottom, which run in slotted face-plates. The casement opens outwards; as it does so there is a sliding movement of its heel along the metal channels provided in head and sill, consequently when it is opened to its normal position there is a small gap for ventilation on the heel side, but when opened fully for cleaning the casement stands at about right angles to the frame, and the glass can be rubbed on either side face from within the room. The sill channel is also so arranged as to form an effective barrier to wind and driving rain. The casements and fittings on the "Exclusive" principle are supplied as follows:—(1) Steel casements and frames complete; (2) steel casements adapted to wood frames; and (3) fittings for wood casements and frames. The fittings are obtainable in gun-metal, brass, and malleable iron (Berlin blacked). A sheet has been prepared giving full instructions for ordering and fixing, as well as a vertical section and plan.

Messrs. A. & J. Main & Co., Ltd., Clydesdale Ironworks, Possilpark, Glasgow, have received authority to add to their Germiston Works, Petershill Road, Glasgow.

The Lichfield Rural District Council at their last meeting instructed Mr. Robert Green, M.Inst.C.E. (Birmingham), to prepare a scheme for the sewerage and sewage disposal of Streetly, and to report generally upon sanitary questions affecting this district.

The Institution of Municipal Engineers will visit the Surrey Commercial Dock to-morrow (Saturday) morning. The dock is very large, and it is estimated that the inspection of a fairly representative number of cargoes would take about two hours. The woods to be inspected will comprise red or yellow fir or deal, white fir or deal, yellow pine, pitch pine, Oregon pine, spruce, birch, and oak.

The "YALE" Horizontal Mortise Knob Lock.

Manufactured by the Yale & Towne Manufacturing Co., the only makers of genuine "Yale" Locks, whose goods are used and known throughout the world. Established 1868.

Gives the security and convenience of the small "Yale" Key, made in nickel bronze. Possesses unlimited key changes. The latch bolt has "Easy Spring," enabling the door to be closed without noise or slamming or turning the knob. Specification and full particulars forwarded on application.

HOUSES AT HAMPSTEAD GARDEN SUBURB. [*J. Bruce Merson, Architect.*

THESE houses are built on the western side of Hampstead Way in the Hampstead Garden Suburb. They were designed by Mr. J. Bruce Merson, M.S.A., architect, 14 Wordsworth Road, Wallington, Surrey, for and built by the Carshalton District Development Company, Ltd. The walls are of brick, finished outside with a red brick plinth up to height of ground floor window-sills and above that covered with rough cast; the roofs are covered with red tiles, and the woodwork of windows and doors generally is painted green.

ORIENTAL SANITARY ENGINEERING.*

(Concluded from last week.)

Sewerage Systems.—Owing to the great difference between the amount of water to be dealt with in the dry and the rainy seasons, a "separate" system of drainage is generally preferable. No "combined" system will prove satisfactory where the rainfall in the monsoon exceed 30 inches, for the sewers need to be made such a size that they cannot be self-cleansing in the dry season; besides which there is a greater danger from the formation of sewer gas when such a system is comparatively empty.

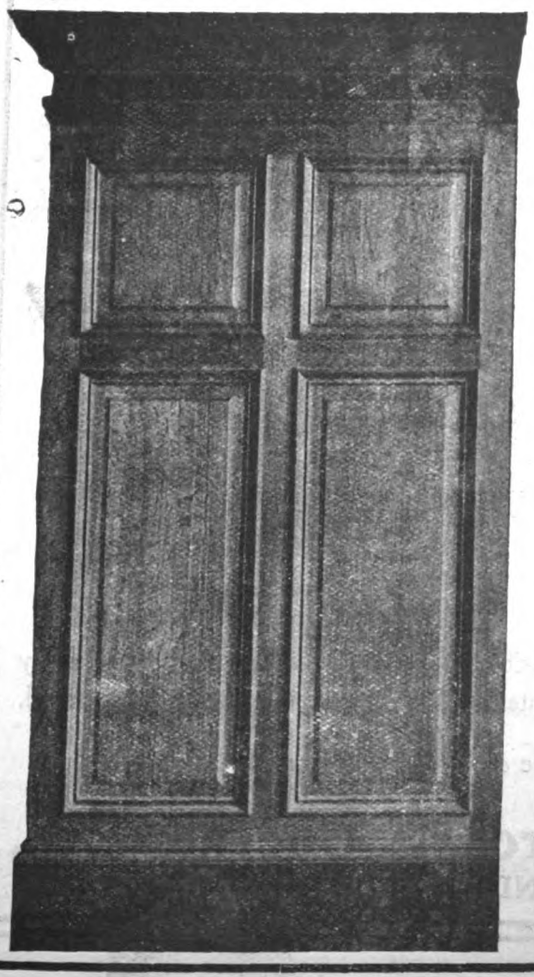
Supposing a separate system is being contemplated, the capacity of the sewer should be sufficient to also take all rain water which falls upon roofs and which drains into open private grounds; in fact, all water which does not drain direct into the surface-water drains in the public street. The reason for this is the undesirability of having different connections for sewage and surface water within private premises, as it is generally less costly to make an unauthorised secret connection with a surface-water drain; and as the natives are prone to do this, it is better to put it out of their power to do so.

Should the sewerage line run along a saturated subsoil, it will tend to greatly improve the healthiness of the district if provision is made to deal with such subsoil water. In such a case the provision should be included in the capacity of the lines dealing with the surface water. It is undesirable to admit such into the sewer.

The provision of catch-pits with by-passes is advisable.

Surface-water Gullies.—The depth of the seal of those on the roadside should not be less than 9 inches, as evaporation takes place so rapidly in hot countries. During the dry season it is sometimes a good thing to fill these gullies right up to the top with sand. This allows the small amount of water due to road watering to soak through and prevents foul air from coming out into the street at an inconvenient level. This point suggests the question of ventilation of sewers. Generally, surface-water drains need no ventilating system, as, although the first heavy flow due to the rains may be a little offensive, the deposits are mineral, and as the rains are practically continuous during the monsoon, the first flow is very soon followed by quite inoffensive liquid.

Regarding sewer ventilation, it is desirable that all vent shafts be made of iron and placed so that the sun shines on them as long as possible. The iron, being a good heat conductor, induces a draught from the sewers Of course, such shafts should be raised above level of top windows of surrounding houses.



A system of placing charcoal trays in surface manholes has at times been tried, but in any humid climate it is quite ineffective, as it is a necessity of such a system that the charcoal remain quite dry.

Gradients.—The gradients of sewers require to be greater than ordinarily obtain in Great Britain, as the latter are insufficient to remove such general solid matter as finds its way into Eastern sewers. Thus, when detritus finds its way in 5 feet per second may be allowed, and where a domestic sewage 6 feet per second.

House Connections.—Exceeding caution has to be used in providing these. The habits and conditions of life of the natives are very hard to combat. In towns large tenement houses abound, and in each living-room there is a washing place (usually about 30 inches square, with a wall 3 inches high around it) in a corner, which is often used for other purposes. Under such circumstances drainage connections, as understood in Great Britain, are impossible, as they would become hopelessly choked. In such cases night soil is disposed of by hand removal, and the sullage should be dealt with by providing down pipes discharging over traps at the foot, the sullage being carried thence along open drains outside. These open drains should be carried along to drain a convenient number of houses, and at the end one sewer connection is made.

Houses of better class having water-closets must, of course, have separate sewer connections. In this case the depth of seal in any trap should not be less than 6 inches. All branch pipes connecting with the street sewer should be 6 inches, and, although this is theoretically far too large for the amount of sewage, &c., passed along it, it is necessary to prevent possibility of choking the pipes due to so much foreign matter being emptied into these drains wherever provided.

* Abstract from paper read at a Sessional Meeting of the Institute of Sanitary Engineers on November 3 by C. T. Evennette (Fellow).

There is more danger to public health in providing water-closets in most natives' houses in India than in the want of them. This remark does not refer to the large or substantial houses of native gentry, but even in their case it is often doubtful wisdom to provide direct sewer connections, as their menials are none too careful.

Jointing of Pipes.—Wherever the banyan tree is seen to be growing near the line of sewers, a good patent jointed pipe should always be provided, as the roots of these trees are most insidious, and in their search after water they will always get through even a cement-jointed pipe.

Public Bathing Places.—These have also to be considered in drainage schemes. The municipal engineer is called upon to provide them. They are generally made somewhat as follows:—A certain area is strongly paved within four walls having a partition wall running along the length, dividing it into compartments for males and females. Two troughs, like large deep horse water-troughs, run parallel to and abut against the partition wall. At one end of the trough a ball cock is provided to keep the water at one level. Bathers come with brass vessels, which they use to dip out water which they throw over themselves. By inclining the floors inwards or outwards, and connecting with the nearest drain, the place is kept efficiently drained; besides which, the water draining from those places is found very useful for helping to flush the surface roadside drains near by.

Public Wash-houses.—Every town having a drainage system and a pipe-water supply should be provided with these, for the insanitary way in which clothes are washed by the natives, if left to find a washing place themselves, is a grave source of danger to public health.

A typical wash-house is made by paving a sufficient surface of ground with smooth stones or concrete, and jointed and set in cement. In the centre of this platform a long trough is built, and fitted with a ball cock to keep the water in the trough at a constant level. Along both long sides of this trough smaller tanks are constructed at close intervals, which tanks the washerman or woman fills by hand from the large central trough. Opposite each small tank a raised and inclined stone slab is provided, upon which the clothes are beaten.

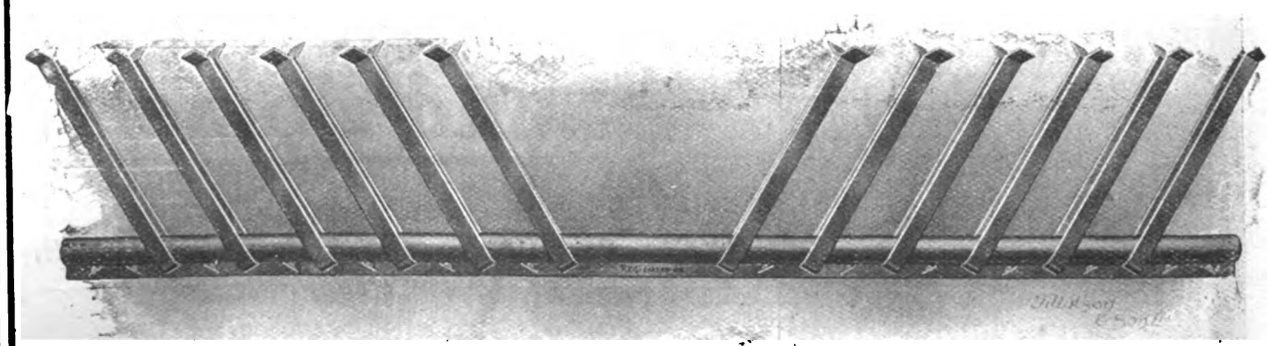
Along one whole side of this washing place, outside the line of slabs, a covered-in shed should be provided, within which clothing can be boiled.

Sewage Disposal.—Except in some large towns of the first importance in the East, it will be found that the sewage is applied to the land or buried. Most municipalities are too poor to contemplate any change, even if desirable, whilst generally it is not really at all necessary.

Providing solids and liquids are kept as separate as possible, no great nuisance arises through smells. When the soil is buried, providing it is deposited in shallow trenches, it is quickly and harmlessly disposed of. If the night soil is passed on to the land, providing the latter is porous so that nitrification can rapidly take place, this method—the most general—will remain the most general for many years to come. It is the natural disposal of a natural product, and, following Nature's cycle, it is life to the vegetable world, which in turn sustains the animal.

Municipal Buildings.

Slaughter-houses.—In India religious prejudices render it necessary that pigs, sheep, and bullocks be slaughtered separately, since the Hindu looks upon the bull as a sacred animal, whilst the pig is an abomination to the Mahomedan. The buildings are designed upon common principles obtaining elsewhere—all that is necessary to specially point out is that both Hindu and Mahomedan calendars authorise numerous fairs and festivals. These very much augment the average daily requirements, so that the floor space required, reckoned according to the population, should be increased by 50 per cent. The water-supply and other auxiliary supplies should be allowed for in proportion.



Also, taking into consideration the average menial native's objection to do work too thoroughly, it is not advisable to slope the floors towards drains. Sloping not only causes the floors to be more difficult to retain a footing on, but the after cleansing is not so efficiently done, as the native will simply sluice them down with water; whereas if the floor be on the level, manual labour with squeegees will be an absolute necessity, thus efficiently cleansing the place.

Latrines—Public and Private.—These should be built so as to ensure (1) protection from the sun and rain; (2) thorough ventilation; (3) receipt of solids and urine by

Avoid uncertainty and worry by insisting on your Concrete being reinforced with

The PERFECTOR TRUSSED BAR

the only Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.

The only system which is proof against the carelessness of workmen.

The Perfector Bar Reinforced Concrete Co.,

Telegrams: "REINFORCED, LEEDS." STANDARD BUILDINGS, LEEDS.

Digitized by Google

separate receptacles, as the admixture causes a more offensive smell; (4) privacy; (5) a water-tight floor.

Markets.—Religious prejudices in the case of markets also require that separate provision in distinct buildings be made for the sale of vegetables, grains and fruits, each separate form of animal and feathered flesh, fish, and for dry goods. It is better, from a sanitary point of view, to support the roofs with iron stanchions, and the buildings should be lofty. The floors should be at least 2 feet above ground level, and a drain should be laid down the centre of every gangway. There should be generous latrine accommodation near, and also refuse bins supplied with covers.

Hospitals.—Some form of hospital accommodation is introduced everywhere under British rule. It is curious to know that from about 300 B.C. up to the occupation of India by Great Britain, little or no hospital accommodation existed for the people; although King Asoka, who lived in the third century B.C., ordered the provision of hospitals throughout his kingdom, and his edict is kept in memory to this day by an engraving on the rocks at Girinar in Guzerat. The population of a place in the East is no certain factor to work upon in deciding the necessary provision of beds, &c., as a large number will not resort to a hospital under any consideration. An average, however, is about one bed per 1,000 souls. For an administrative hospital about 1,500 super. feet of site per bed is a fair average figure with which to calculate the site area required for hospital buildings, including offices, in the East.

Regarding choice of site, a site having a low subsoil water level which is permanent is best, and, if no such place can be found, the subsoil water level should invariably be lowered by drainage. No hospital should be built on "made" soil, or if it is imperative to do so the site should be covered with a thick layer of concrete. The buildings should face so that winds from a malarial district do not blow in through the windows, but should no such dangerous winds prevail, the windows should face in the direction to enable the most generally prevailing winds to find entry.

In malarious climates ward floors should be about 10 feet from the ground, with through air space beneath, and in ordinary damp climates should be raised by means of arched basements to a height of 3 or 4 feet to secure air space beneath.

Building Materials.—A very large number of sun-dried bricks are made in India. These are called "kutcha" bricks, in distinction to burnt or kiln bricks, which are termed "pucka." These two terms are also colloquially used to express ripe and unripe, good and bad, permanent and temporary, &c.; *e.g.*, a "pucka" appointment is a "permanent" one; if a native considers you "kutcha" it is the reverse of complimentary! Please excuse this digression. It is not desirable to use "kutcha" bricks in places infested with white ants, and buildings constructed with such bricks should always be coped with "pucka" brickwork, and the roof eaves should project well, to keep rain off the walls as much as possible. There is a variety of limestone extensively found in India called "kunkur," which is most useful. It is a subsoil tufa formed by the depositing of calcareous matter extracted in particles from sand and clay beds by surface waters and redeposited in a concentrated form. When the redeposit takes place in a clay bed a hydraulic limestone is the result. It is necessary to remember that lime made from kunkur—which is a marl lime—will not stand any admixture with such material as powdered burnt clay or brick without such materials lessening its natural strength.

In making mortar in India a small quantity of very coarse sugar, called "gow," is often used with distinct advantage to the strength of any fat lime. In this matter it should be remembered that no sugar must be used for any mortar made partly with powdered brick, termed in India "soorkee." "Soorkee" mortar is made of one of lime, one of sand, and one of powdered burnt clay or brick, except when rapid setting is required, when the proportion of soorkee is increased and sand decreased. A very good artificial cement is made from one of soorkee to one of lime.

Regarding timbers in construction work teak and sal wood best resist attacks by insects, while the banyan tree wood, although useless for ordinary work, being light and brittle, is very useful under water for use as well curbs, &c. Timber from the cotton tree is also very useful for work under water.

The British municipal engineer serving in the East is a conscientious and very hard-working individual generally, with responsibilities mostly far in excess of those falling to the lot of engineers in the same relative position in Great Britain. The former's task, on the whole, is rather dreary. He receives scant recognition from the native communities he endeavours to serve, and not more from his own country, although his "common sense" and initiative are oftener, of necessity, called into requisition. (One seldom hears of a successful municipal engineer abroad being selected by any municipal body at home, although applications are made more often than is generally known.)

The average native contractor's qualification to undertake a work is, as often as not, solely a financial one. Under these circumstances the municipal engineer's lot with a sanitary work of any importance in hand can easily be appreciated.

THE President of Pennsylvania Railroad has announced a project for the erection of a new union passenger station at Chicago to cost not less than $25,000,000.

MR. EASSON, civil engineer, Glasgow, has been asked by the Dunfermline Corporation to prepare a report as to the expediency and cost of establishing purification works at the south side of the town, and continuing the present pipe to Charlestown.

THE Annan District Committee of Dumfriesshire County Council last week adopted the scheme reported upon by Mr. James Watson, C.E., Bradford, and Mr. James Barbour, C.E., Dumfries, for the taking of a water supply for the Lower Annandale special water supply district from a reservoir of 60,000,000 gallons capacity, to be constructed on the river Mein at Torbeckhill at a total estimated cost of 49,000*l*.

MR. WILLIAM SHEFFIELD, the founder of the firm of Sheffield Bros., builders and contractors, of Dalston, died at his residence, Cranbrook, Manor Road, Stoke Newington, last week. Mr. Sheffield was born in 1828. He came to London when eighteen, and later went to Australia, where for years he carried on business as builder and contractor. On his return to London he settled in Stoke Newington.

THE COMPULSORY ISOLATION OF APPARENTLY HEALTHY PERSONS.

OF recent medical developments nothing is more important than the discovery that persons in apparently good health are capable of carrying infectious germs for an indefinite period and distributing them. These "carriers" are obviously a danger to the community, and every effort is being made in hospitals and laboratories to find some effective means of driving the objectionable bacteria from the systems of afflicted persons.

The recent action of Sir William Collins in drawing the attention of Parliament to the detention of five soldiers at Millbank Military Hospital at once interested the general public in a matter that has hitherto been confined to professional circles. These soldiers, as the result of close observation by army surgeons, were strongly suspected of harbouring and excreting the bacillus of typhoid. All five of the soldiers referred to exhibited no signs of ill-health beyond the excretion of the bacilli. Mr. Haldane admitted that so far no cure had been effected by the use of vaccines at Millbank, though persisted in for many weeks, and he added that cases had been recorded in which the bacilli were excreted by typhoid patients two years after they had been discharged from hospital as "cured."

Early in 1908 the then medical superintendent of the Monsall Fever Hospital at Manchester—probably the largest institution of its kind in this country—contributed to the medical journals a note on the internal treatment of typhoid fever on antiseptic lines. He used medical Izal Oil with remarkable results. It was found that when the drug was administered for a sufficiently long period the bacilli of the coli-typhoid group usually disappeared, and the patients were discharged free from any suspicion of being "carriers." During the first year that this internal antiseptic treatment was introduced at the Monsall Hospital the case mortality from enteric fever was the lowest on record for that institution. It will not unlikely prove that the remedy for chronic "carriers" will be found in the internal administration of antiseptics such as medical Izal Oil, a method of treatment now being extensively used in fever hospitals at home and abroad.

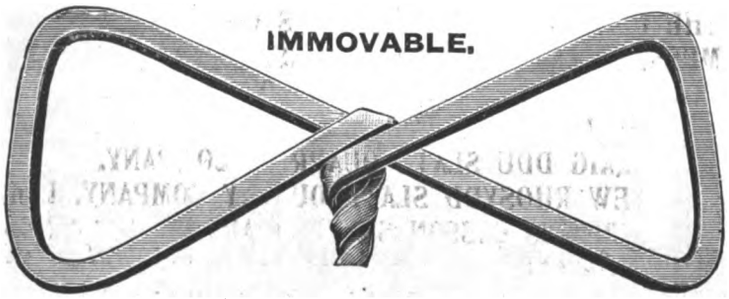
Used by H.M. Government.

All TIES Made from MILD FLAT STEEL.



Galvanised or Coated with Special Protective against Oxidation.

OVER 10,000,000 TIES HAVE ALREADY BEEN USED.

ADVANTAGES OF CAVITY TIE.

Perfect Bond with Brickwork.

The greatest possible strength with the least possible material.
Cheapness. Its construction shows that no cheaper Bond can be made.
Forms no obstruction in the cavity for mortar and other matters to lodge upon.
Cannot hold or convey damp or moisture.
Obviates the necessity of through Headers in Faced Walling.

ADVANTAGES OF SOLID TIE.

Perfect Bond with Brickwork.

Greater Economy and stability in Faced Walling.
Two straight and plumb faces to brick lengthwork.
In 12's wire for stock or other fine jointed facing.
In 10's wire for common work and outside Walling.

MADE in any LENGTH & STRENGTH for CAVITY or SOLID WORK.

Specified by the Leading Architects, and used by the Principal Builders throughout the Country.

The WARRINGTON BOND IRON SYNDICATE, Ltd.

Brewery Street, Ardwick, MANCHESTER.

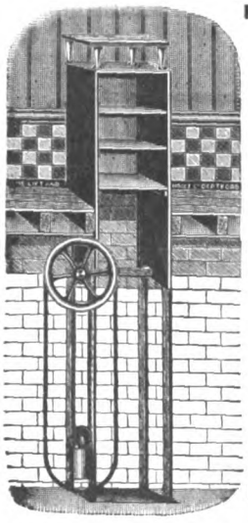
THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.



¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable subsiance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

HERNE BAY.—Nov. 30.—The Urban District Council invite designs for a pavilion to be erected on the proposed pier extension at a cost of 4,000*l.* Premiums of 25 guineas and 10 guineas. Deposit 1*l.* 1*s.* Mr. Joseph Jubb, clerk, Town Hall, Herne Bay.

IRELAND.—Dec. 1.—The Tralee Urban District Council invite designs for a proposed Carnegie library and technical school, to cost not more than 4,500*l.* Premiums of 20*l.* and 10*l.* The Town Clerk, Tralee, Ireland.

LEAMINGTON.—Dec. 3.—The Council offer a prize of 10*l.* for the best design for an extension of the cooling-room at the pump-room and baths. Mr. Leo Rawlinson, town clerk, Leamington, Warwickshire.

LEEDS.—Dec. 18.—The education committee invite architects practising in Leeds to submit designs for proposed training college for teachers, Kirkstall Grange, Far Headingley. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed to assist the committee. Deposit 2*l.* 2*s.* Mr. James Graham, Secretary for Education, Education Department, Leeds.

MINEHEAD.—Dec. 11.—For a shelter with cloak-room and lavatories, on the beach at Minehead, Somerset, to cost not more than 3,000*l.* Deposit 5*s.* Premium 20*l.* The premiated plans to become the property of the Council; or, in event of the architect carrying out the work, the premium will merge in the commission. Mr. L. C. Webber-Incledon, clerk, 16 Park Street, Minehead, Somerset.

OLDHAM.—Feb. 1.—The Town Council invite competitive designs from architects practising or residing within the borough for an extension of the town hall. Premiums of 50*l.*, 30*l.*, and 20*l.* are offered, together with 5*l.* for every competitor who carries out the instructions. Apply to Mr. E. C. Foote, borough surveyor, Oldham, Lancs.

OTLEY (YORKS).—Dec. 3.—The Governors of Prince Henry's Grammar School invite applications from architects willing to submit designs and estimates for new school buildings in Farnley Lane. It is intended to allow from twenty to twenty-five competitors. Apply to Mr. Ernest S. Mead, clerk to the Governors, East View, Otley.

WALES.—Jan. 31.—The Council invite designs for a National Library at Cardiff. Three premiums are offered. Assessors, Sir Aston Webb, R.A., Mr. John J. Burnet, A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A. Deposit 2*l.* 2*s.* Apply to Dr. Wm. Evans Hoyle, Director of the Museums, City Hall, Cardiff.

WORKINGTON.—Nov. 30.—The Cumberland education committee invite architects to submit sketch plans with outline specification and estimate for a technical and secondary school in the borough of Workington, Cumberland, for about 300 pupils of both sexes. Deposit 1*l.* 1*s.* Mr. C. Courtenay Hodgson, secretary, The Courts, Carlisle.

WARMINSTER.—Dec. 1.—For building proposed additions to Sandhayes, Corsley. Mr. A. F. Long, architect, 53 Market Place, Warminster.

WRENTHORPE.—Dec. 3.—For building heating chamber and installation of hot water heating system at Wrenthorpe school, near Wakefield, for the Stanley district education committee. Mr. Alexander Angus, 128 Northgate, Wakefield.

YARDLEY.—Nov. 29.—For works of drainage, excavation, levelling, construction of paths, pool lavatories, and boundary walls, &c., at the Sparkhill recreation ground. Deposit 3*l.* 3*s.* Mr. A. W. Smith, engineer and surveyor, Council House, Sparkill, near Birmingham.

MR. BASIL MOTT and Mr. Alexander Stenning have been appointed by the Bridge House Estates Committee of the Court of Common Council as expert advisers in connection with the widening of Southwark Bridge and the erection of the new St. Paul's Bridge.

THE Special Works Committee of the Plymouth Corporation at a meeting on Monday considered a communication from the Local Government Board transmitting copy of a letter received from the Association of Trade Protection Societies complaining that the building by-laws prohibited the use of hollow concrete blocks in buildings, and inquiring whether it would be possible for the by-laws to be amended to enable such blocks to be utilised. The Board asked for the observations of the Council on the letter, and intimated that they would be willing to consider any amendment the Council might desire to make. The committee, however, decided that they could not recommend any alteration in the existing by-laws.

TRADE NOTES.

MESSRS. HUDSON & KEARNS have sent us specimens of their registered date indicating blotting pads for 1910, which as usual are excellent and conveniently arranged, but unfortunately most architects receive gratis more blotting pads than they want from manufacturing firms, who put their own names prominently forward. Those architects who do not care to be continually reminded in this way may escape the infliction by buying from Messrs. Hudson & Kearns.

LAST week a test was carried out at the Royal Palace Hotel and Empress Rooms, Kensington, with a new fire protective installation which has recently been fitted up by Merryweather & Sons, in connection with the Hydraulic Power Company's main. The main carries water at a pressure of 750 lbs. to the square inch, and a special hydraulic hydrant is provided by means of which the pressure at the discharging nozzle is reduced to a suitable pressure for fire extinguishing purposes, such as can be readily withstood by ordinary canvas hose. Ten of these hydrants are provided on the various floors of the building, each fitted with 120 feet of canvas hose and nozzle, enabling a fire to be promptly attacked at any point where it may break out. A jet was brought into play on the roof, which is over 100 feet from the ground, and it was found that the pressure was ample for fire extinguishing purposes. Of course, at such a height as this, the pressure from the ordinary water supply mains would be quite inadequate. A special feature of the hydraulic hydrants is that they are each fitted with a relief valve, so that in the event of the hose becoming kinked or twisted this valve automatically operates and prevents a burst hose resulting.

VARIETIES.

Mr. W. E. Mills, A.R.I.B.A., Oxford, has prepared plans for the reconstruction of the east wing of the Oxford Union Society's premises.

The Limerick County Council have decided on the construction of a bridge over the Shannon at Castleconnell at a cost of 12,000*l*.

The Gravesend Town Council are going to erect an open-air swimming bath in the Gordon Recreation Ground. The outlay will be about 2,000*l*.

The Vulcan Match Company, of Sweden, have purchased from the Barking Town Council a site for a factory. The ground has an area of about seven acres and was purchased for 3,850*l*.

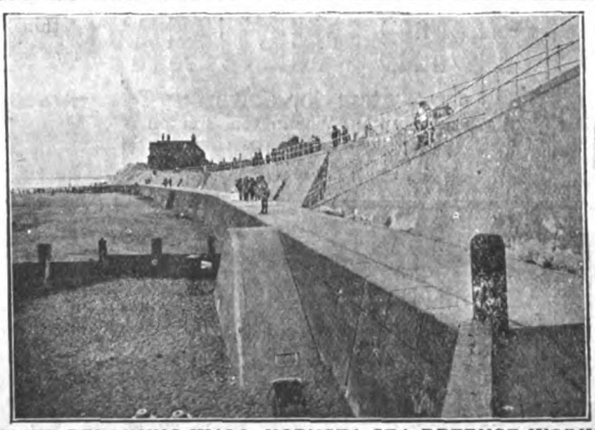
At the Crystal Palace there is to be seen the largest and finest asphalte roller skating surface in the world. After considerable redecorating and refurnishing the rink was re-opened on Wednesday for the tenth season.

Major Stewart, an inspector of the Local Government Board, held an inquiry at Radcliffe recently into an application by the district council for sanction to borrow 13,000*l*. for the provision of new municipal offices. The application was strongly opposed.

An Eastern district committee has now been formed to the Institution of Municipal Engineers. Mr. J. H. Webb, borough surveyor, of King's Lynn, has been elected chairman, and Mr. R. G. Coates, district surveyor to the Norfolk County Council, secretary to the district.

The Maumbury Rings Excavation Committee contemplate carrying out next autumn the third, and probably the final, series of excavations in order to clear up points in connection with the Roman use of the amphitheatre. It is expected that the third period of digging will be of longer duration than the two preceding.

The Local Government Board have informed the York City Council of their general approval of a scheme of sewerage and sewage disposal into which an inquiry was held recently, relative to the application for a loan of 57,658*l*. A revised scheme showing suggested modifications with estimates is to be prepared for the Board.



The Edinburgh Dean of Guild Court last week passed the plans for a cattle mart at Gorgie for Oliver & Son, Ltd., which will cover an acre and a quarter of ground. The building, which will be in one block, will be of brick, and will be roofed in in four spans. The cost is expected to be 12,000*l*. Messrs. Cooper & Taylor, architects, Edinburgh, have prepared the plans.

The Dublin Corporation have received sanction from the Local Government Board for the following loans:—(1) 10,000*l*. for advances under the Small Dwellings Acquisition Act; (2) 3,000*l*. for completion of refuse destructor, and reclaiming Fairview Slobland; (3) 75,000*l*. for extension of electric light mains and plant; (4) 1,320*l*. for lighting of North Circular Road and Drumcondra.

Mr. P. C. Cowan, M.Inst.C.E., chief engineering inspector to the Local Government Board for Ireland, opened an inquiry last week at Belfast into an application by the Belfast Corporation for the sanction of the Board to a loan of 30,000*l*. for the purpose of erecting a public abattoir. In July 1899, the loan of 30,000*l*. was sanctioned, but the borrowing of the sum was not effected by the Corporation, who have submitted different plans. The Board consequently decided to hold a further inquiry.

The Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels announce that the grants voted at their meeting last week have practically exhausted their funds. During the past ninety-one years 9,236 places, *i.e.* more than half the parishes in England and Wales, have been aided by the society with grants from the General Fund amounting to 1,068,110*l*., and 995 grants have been made from the Mission Buildings Fund amounting to 26,724*l*.

The Corporation of Aberdeen have given formal intimation of their intention to apply to Parliament in the ensuing session for power to take a water supply from the river Avon, Banffshire, by means of forming an impounding reservoir on the river at that point. It is proposed to convey the water by pipes through the parishes of Kirkmichael, in Banffshire, and Strathdon and other parishes in Aberdeenshire, to a reservoir at Wardhead, about three miles west of the city. From Wardhead the water would be distributed to the existing reservoirs at Pitfodels, Slopefield, and Mannofield. The

length of the aqueduct is fifty-two miles, and the supply contemplated is ten million gallons per day. The works, it is expected, will occupy about ten years, and the cost is estimated at 1,068,000*l.*

THE Finance and Leases Committee of the Dublin Corporation have issued a report recommending the erection of new municipal buildings for the accommodation of officials. It is proposed that the new offices shall be built in Lord Edward Street on a site already the municipal property. This would give a frontage of 294 feet, with two return blocks, running back to Castle Street. The Committee also state that a third return building could be erected, if required, for an art gallery. It is proposed that the buildings shall be three storeys in height. The estimated cost is between 40,000*l.* and 50,000*l.* The existing City Hall would be retained.

THE Local Government Board have written to the Dublin Corporation relative to an inquiry held into their application for a loan of 100,000*l.* to complete the main drainage of the city. The Board subject the application to considerable criticism. They point out that a resolution of the Council, passed on November 6 of last year, binding contractors only to employ men who had a minimum residence of two years in Dublin is "an unnecessary and unwise addition to the existing restrictions on the freedom of contractors for Corporation work." They further state that the prices estimated for the work in this case are too high, and they disapprove of the work being done by direct labour—it being, in their opinion, most desirable for all parties concerned that "the work should be put up for competitive tenders from competent and solvent contractors." Until these objections are satisfactorily disposed of, the question of sanctioning the loan will not be considered.

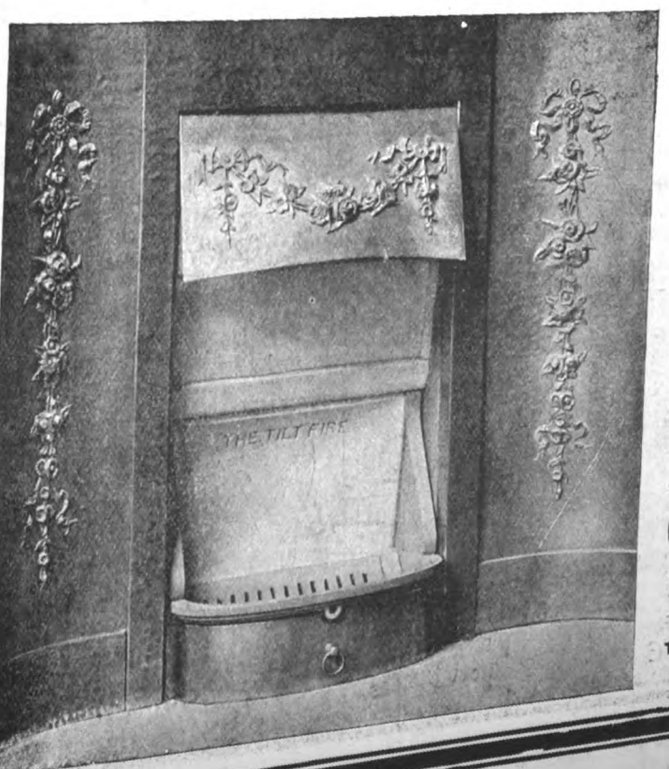
THE CRYSTAL PALACE SCHOOL OF ART.

MR. MATTHEW WEBB'S lectures have become quite a popular feature, and he has chosen for his subject "The History of Art from Prehistoric to Present Time." He will deliver the fourth of a series on Tuesday next, November 30, in the hall of the Crystal Palace School of Art, at 5.30, when he will deal principally with the struggle between Saracenic and Christian art, especially exhibited in Spain. These lectures are made the more interesting by some splendid limelight illustrations. In the course of a recent lecture Mr. Matthew Webb reminded his hearers that in the Egyptian Court at that institution the details of all kinds of Egyptian art were very faithfully copied from remains in Egypt. He thought it was very much to be regretted that there were no notices descriptive of the courts themselves and their contents appended somewhere within easy view of the general public, and if it should ever be determined to pull them down it would be absolutely lamentable, for nowhere else in the United Kingdom, or indeed anywhere, was there such an unique display of Egyptian art as in the Crystal Palace Court.

THE ILLUMINATING ENGINEERING SOCIETY.

THE inaugural meeting of the first session of the Illuminating Engineering Society was held in the hall of the Royal Society of Arts, Professor Silvanus P. Thompson, President, in the chair.

The Hon. Secretary, Mr. Leon Gaster, in reading the report of the Council, stated that within the last few years there has been a great development in methods of illumination, and there is now at the disposal of the consumer a bewildering variety of illuminants. At the same time, changed industrial conditions have led to the use of much more light, and taxing the eyes by the injudicious placing of powerful lights, &c., to a much greater extent than a few generations ago.



This led to a strong sense of the value of a Society capable of dealing impartially with the problems of illumination. The successful career of the Illuminating Engineering Society in the United States, which has been in existence for several years, strengthened the view that an organisation with similar aims, in Europe, might do very useful work.

The Illuminating Engineering Society in this country dates from February 9, when an informal dinner was attended by a number of gentlemen, representing various trades and professions, who were interested in its formation.

On that occasion the Hon. Secretary, Mr. L. Gaster, briefly summarised the steps in the progress of the movement.

In 1906 he had invited those interested to co-operate with him in order to found such a society, and a number of gentlemen then came forward. Subsequently, however, he felt that the time was not quite ripe for the initiation of a truly representative body, and in 1907 he paid a visit to the United States and learnt the experiences of nearly all those who had been instrumental in promoting the Society having similar aims. Subsequently he visited the Continent with the object of interesting the best known authorities in lighting in the movement. There, as in the United States, the idea met with enthusiastic approval, many of those who promised their support also consenting to act as contributors to the journal.

It was felt to be necessary to devote some time to bringing home the need for the Illuminating Engineering Society and to educating the public to its aims and aspirations. The hope was expressed, and has been amply justified, that the journal would be the means of illustrating clearly the nature of the work which the Society would be called upon to perform ; also that it would act as a means of collecting together all those interested who would afterwards form the nucleus of the Society.

During this time it was noticeable that more attention came to be devoted to matters connected with illumination in the technical press, and the attitude in many quarters towards the movement became increasingly favourable as its nature became more fully understood.

It was next arranged that the *Illuminating Engineer*, of which Mr. Gaster was editor, should become the official organ in order that the Society might be able to profit by its existing connection and reputation, and so practically escape the expense involved in publishing transactions.

It was felt that, with the opening of 1909, the time was ripe for active steps to be taken in forming a Society. The general feeling of those present at the dinner referred to was strongly in favour of starting without further delay, and a committee, representative as far as possible of the various professions and trades interested, was appointed to consider the framing of statutes, &c.

At a meeting of the supporters held at St. Bride Foundation Institute, London, on May 25, the draft constitution was passed subject to certain modifications of detail such as legal considerations might suggest.

The existing committee was also reappointed with power to add to its number, and thereby form the nucleus of the Council of the Illuminating Engineering Society. The Council, although very representative, does not as yet contain the maximum complement of members, it having been thought advisable to leave some vacancies to be filled up as occasion might demand.

The Council next proceeded to consider the question of election of a president, and are happy to report that Professor Silvanus Thompson, D.Sc., F.R.S., has consented to act as president ; the Society considers itself singularly fortunate in possessing as first president one who has devoted so much attention to the scientific aspects of illumination, and has taken a great deal of interest in all methods of lighting.

In addition the Council have approached a number of authorities in different countries with a view to their becoming vice-presidents. Here again they have secured exceptionally influential and international support. The Society starts with a membership of over 164.

In order to secure additional representation, special provision has also been made in the statutes for the inclusion of corresponding members, who are willing to aid from time to time by their advice on local questions, or in connection with aspects of illuminating engineering on which they are recognised authorities. The Society has already been able to secure corresponding members in many of the chief Continental and American cities, and hopes to extend the list still further.

A few words may be said as to the aims, objects, and aspirations of the Society.

In the first place the main object is simply to provide an impartial platform where questions connected with illumination may be discussed. Owing to the absence of such a platform there has been a tendency for misleading or one-sided statements to be circulated and there are many questions on which authoritative information is badly needed. It is therefore desirable to provide a common meeting ground, not only for engineers connected with different systems of lighting, but also for members of the medical, architectural and other interested professions ; through the free exchange of views thus brought about it is hoped that not only will those connected at present with some particular aspect of illumination learn from one another, but that eventually a certain number of experts fully qualified to take a wide and impartial

view of the whole problem will be evolved. The ideal expert of this kind has been called "The Illuminating Engineer," and there are doubtless many matters of public importance, such as street lighting and the illumination of schools, hospitals, libraries, museums and other important public buildings in which his services would be invaluable.

But for the present the career of the Society will be largely one of mutual education and the spreading of knowledge among the general public. It is therefore hoped that the Society will be instrumental in raising the standard of knowledge of illumination among those who, in one capacity or another, are at present engaged in problems of lighting. Membership in the Society does not by itself qualify anyone to be recognised as an "illuminating engineer."

The ground to be covered by papers is naturally extremely wide, and there are many points of common interest to those connected with all illuminants. The Illuminating Engineering Society, having expressly framed its Constitution with a view to impartiality, can justly claim to be in a position to deal with problems in which the spheres of influence of the different illuminants are concerned in a manner in which no other society can do. Under these conditions the claims put forward by representatives of one or other illuminant will be examined impartially and the possibility of misunderstandings or onesided discussions reduced to a minimum.

In reality, the ground which it is desirable to cover in a session is almost too wide to be treated in the course of the meetings available. It is hoped, however, that the Society will be able to cover additional ground in the future by organising courses of lectures to deal with elementary matters, or with detailed questions which appeal to experts of a certain class, but are not such as would be suitable for prolonged discussion at a general meeting.

The Society also hopes to be instrumental in organising Congresses for the discussion of points of special consequence and exhibitions of the most recent developments in lighting and photometrical and measuring apparatus.

In addition, it is hoped eventually to be in a position to accumulate information and to deal with technical points by means of committees of specialists. In such cases, it is suggested, the international connection of the Society will be specially valuable, as it will enable the Society to be in touch with experts in all parts of the world, and, if necessary, to organise series of researches in different countries on a common and predetermined course of action. It is also anticipated that the international connection of the Society will enable it to be specially instrumental in dealing with points of international importance, such as questions connected with units, nomenclature, standardised conditions of testing, &c. At present owing to the difference in the conditions under which researches in various countries are carried out, often the results obtained are not intercomparable.

WALL DECORATION.

It is generally agreed that within the past decade there has been a marked advance in the standard of taste exhibited in house decoration. Some thirty years ago there appeared to be a cult of ugliness abroad in this country which overwhelmed all the excellences that had been bequeathed by preceding periods. Happily this was only a transient phase; perhaps even it served a good purpose in so far as by force of contrast it emphasised both the beautiful and the ugly. There is difference of opinion as to who is deserving of the credit for the gradual abandonment of Victorian ideas for freer and truer guiding principles. Some hold that the public themselves led the way out of the dark and dreary by-ways down

which they had strayed; others give the credit to professional and self-appointed teachers; while others, a comparatively few others certainly, tender their gratitude to the business firms who provide for the decoration of our homes. Perhaps honour should be rendered to all three—to the public which grew dissatisfied with artifice and dreariness; to the teachers who fostered if not inspired that discontent; and, lastly, to the tradesmen who were quick to seize the opportunity for abandoning the models and modes of the past and for meeting demands that had scarcely yet crystallised. It is indisputable that the big wholesale and retail firms have played and are playing a prominent rôle in this reawakening. It is their business to divine the impending wants of their customers, and it is their privilege to subtly influence that demand. Sometimes this may be abused, but more often the responsibility is gravely undertaken and the results are seen in that general improvement which is to be witnessed on every side.

The starting point is the decoration of the room itself—that is to say, of its walls, the ceiling, and the floor. Here there is an extensive and rather bewildering choice. So far as walls are concerned a visit to the showrooms of the Wall-paper Manufacturers, Ltd., at 1 Newman Street, Oxford Street, W., will show one very excellent way that is to be put on sale at the beginning of 1910. The showrooms have just been redecorated and show the latest designs in Lincrusta-Walton, Cordelova, and Caméoid self-decorations. The ceilings and friezes are covered with these two latter substances which are particularly conspicuous both for their designs and for the fact that they are readily cut to fit in the most awkwark shape without loss of effect. But these materials are familiar to architects. What is shown for the first time is "Metaxin." This is a wall-paper with a surface of artificial silk, but which contains no metallic bronzes (and consequently is permanent in colour), is washable and is germ-proof. It is to be made in fifteen colourings and sixteen patterns; of these a few are already in the showrooms, and the purchasers may choose between effects on satin, brocade, watered silk, &c., and tints of old gold, rose red, green, white, gold, plum red, and so on. The paper is, of course, a superior one, but the manufacturers say that it is the cheapest high-class wall paper obtainable. It has, moreover, the no small recommendation that it is made in this country, and not, like most of its rivals, abroad.

LONDON MASTER BUILDERS' ASSOCIATION.

THE ordinary monthly Council meeting of the L.M.B.A. was held on Thursday, the 18th inst., when the President (Mr. F. G. Rice) occupied the chair. The meeting was of a lengthy and discursive character, and was protracted till quite a late hour.

The question of a builder who is appealing against the decision of an arbitrator was considered. The opinion of counsel was read, and certain course of action decided upon.

On the report of the proceedings of the organisation committee a long discussion took place as to the eligibility of sub-contractors for associate membership, the same firm frequently trading both as builders' merchants and as sub-contractors specified by architects, and therefore exposed to the same attacks as the master builder himself. Under such circumstances it was considered hardly fair for the builder to have to do all the fighting in the event of a trade dispute while the sub-contractor could stand aloof and even extend his operations. It was proposed by some that those who are likely to compete with the builder should give an undertaking to take the same chance as he does, and support him in case of need. It is well known how much disorganisation is caused by some sub-contractors. They treat the builder as of no account, use his plant, and, indeed, ride rough shod over him while the enduring builder has to bear all his annoyances without satisfaction to his general operations, and with little or no profit.

After remarks by Messrs. F. Higgs, J. Carmichael, Wr. Lawrence, jun., Ernest J. Brown, W. F. Wallis, Frank May, Col. G. Haward Trollope, F. L. Dove, it was agreed by the Council that those firms who are specified by architects to carry out work usually done by the building contractor be considered sub-contractors.

One firm was elected as ordinary member, Messrs. R. Woollaston & Co., Limehouse; sixty-eight associate members were elected.

The President produced his draft of the addition to the history of the Association, to be given in the 1910 "Diary and Handbook," and the Council approved it.

The question of a trade paper being issued free to every ordinary member of the Association was considered, and referred to the finance committee for consideration and report.

THE DISPOSAL OF SEWAGE AT A COUNTRY HOUSE.*

THE laws of sanitation are as old as the Decalogue. Moses made rules and regulations for the guidance of the Jews, both as regarded their persons and their dwellings. Nor were the Romans blind to the virtues of sanitary methods, and to this day may be seen remnants of their work; for example, the Cloaca Maxima and various drainage arrangements of famous Roman villas are still extant, but it has been left to the English nation to bring sanitation to its present state of perfection. As a nation we are thoroughly practical, and the waste of life and power implied by a high death-rate has induced us to take steps to remedy conditions capable of being remedied. It sometimes happens, however, that the first remedial step is a miscalculation and produces temporary dislocation of sound plans. For instance, when the water closet was first introduced there were no sewers, and although the system of water carriage was good in itself (it was in fact the foundation of the cleanliness which exists to-day, and without which no great city could prosper), yet it was upon the introduction of the water closet that the cess-pool with all its dangers to health became a common necessity, and in the early part of the century these cess-pools were to be found in the most unexpected places. There are evidences in some of the old London houses to-day of cess-pools having been constructed in the basement of the houses and even under the kitchen floors. When those cess-pools were filled others were constructed, and in their turn they became a nuisance and a danger to health. Altogether the last condition became worse than the first.

In the twentieth century it is quite unnecessary to show that an insanitary condition is productive of disease. At the same time the cost of sanitary work is so great that it serves a good purpose to recall on occasion one or two historical facts. For example, Dr. Laycock, in giving evidence before the Town Commission in the middle of the last century, stated that in the city of York in 1664, when the plague broke out, the proportion of deaths was one to three living, whilst in 1832, after several salutary and costly lessons when cholera broke out in the same city, the proportion was very different—namely, one death to 142 persons—but even then the condition of things was very bad, as a document which Laycock found in the city archives proved. There were wide stagnant moats, the streets were narrow and filthy, the only drainage was to be found in open channels in the streets, and altogether the condition was very far from what we speak of as a hygienic state of affairs. Such a condition of things is hardly credible in the present day.

We know that the death-rate in England bears most favourable comparison with the death-rate in other countries, but within the past few years rapid strides have been made by every country in the direction of improved sanitation. There is hardly a country in Europe that has not made vast improvements, and visitors from every corner of the globe visit the chief towns in England to ascertain what works are being carried out to promote the health of the community, and of chief interest to those visitors are the methods of disposing of sewage. I have had the pleasure of conducting representatives from almost every country in Europe and every colony of the British Empire over the works which the Birmingham Drainage Board have constructed in the valley of the Tame. The reason for our lead in this respect is very accurately and succinctly stated by Mr. Whipple, of New York, in his report on a visit to Europe:—

"England has taken the lead in these matters, and it is there that one must go to find the latest developments in the art of sewage disposal. If one asks the reason for this, a fitting reply is found in the old adage that 'Necessity is the mother of invention.' The English rivers are small, the English cities are large and numerous, and the amount of manufacture carried on in them is very great; consequently the streams are badly polluted, and the need of sewage purification works is pressing. Furthermore, the soil of the country is not well suited for land treatment of sewage, and in consequence the English engineers have been forced to adopt other methods. This has stimulated their ingenuity and given rise to many modifications of chemical and bacterial processes. In England, therefore, one can see more and learn more of sewage disposal at the present time than anywhere else in the world."

* A paper read before the Institute of Sanitary Engineers at Birmingham on November 16, by John D. Watson, M.Inst.,C.E., President of the Birmingham and Midland section of the Institute of Sanitary Engineers.

SEE THAT THE NAME YALE IS ON THE LOCK.

Nor does this testimonial from the New World stand by itself. The New York *Municipal Journal and Engineer* in 1906 began an article on the disposal of refuse by saying:—

"It is admitted by all engineers that England is at least fifty years in advance of this country both in the collection and disposal of its garbage and refuse."

It may be taken for granted that municipal authorities in England, as representatives of their respective cities, have recognised their responsibility in promoting healthy conditions, and since the adoption of the County Councils Act, 1888, the same might be said of county authorities. In England our progress is generally the result of pressure from the intelligent public, not coercion on the part of the wise minority, as in some other countries, but the public, having seen and understood the advantages accruing from improved sanitary conditions, are unwilling to forego or minimise them, and they have brought pressure to bear upon the Legislature along lines advocated by such institutions as the Royal Sanitary Institute and the Institute of Sanitary Engineers.

Since 1888 County Councils and their officers have done noble service for the rural districts, villages, &c., and although a great deal remains to be done, the fruits of their skilful, zealous and unselfish labours are becoming evident in the healthier dwellings and surroundings of the labouring classes. There is still much work to do, some of it in a direction which is not easily reached by officials.

There are mansions and homesteads which are far from being healthy, although charmingly situated on high land and surrounded by sylvan beauties. There are many mansions drained into beautiful streams which form the sources of water supply to thousands of people lower down, and no attempt at purification of the sewage is made. There are streams which may not be characterised as pure, flowing past great houses which add their quota of impure liquid. The owners of such houses grumble about the condition of the streams and recall the good old days when fish were plentiful, but they do nothing to render the sewage from their own properties free of impurity before it joins a stream. How are we to remedy such defects? First, by making the owners and occupiers realise the need for improvement; and, second, by adopting an efficient method of effecting it. This Institution concerns itself with the latter, and for this evening I propose to direct your attention to that section of the work which deals with freeing the sewage from its noxious ingredients before it is allowed to flow into a stream.

Assume, therefore, that everything inside the house is all that can be desired, and that the question is how to get rid of the sewage without infringing the statute and without being liable in damages at common law. Assume also that there is no wish to evade the Rivers Pollution Prevention Act, 1876, which enjoins that the best practicable and available means should be taken to purify the sewage before discharging it into the stream, and we are face to face with the question, What is best to be done? In determining this the following information is required, and should be obtained by the engineer to enable him to recommend a particular scheme of purification:--

1. The chemical composition of the sewage to be treated.
2. The population to be provided for, existing and prospective.
3. Whether the drainage includes roof water; whether, in fact, it is on the combined or separate system.
4. The amount of water supply.
5. The variation of flow to be dealt with.
6. The disposition of the available site, difference of elevation between the outfall drain and the stream into which the effluent is to be discharged.
7. The relative volumes of effluent and stream.

Each case should enfold its own needs, and the more exhaustively the circumstances are inquired into during the preliminary stages, the more likely is the scheme to give permanent satisfaction.

I attach much importance to ascertaining exactly the nature and composition of the sewage to be dealt with. I have known purely domestic sewage so concentrated that it had to pass through two percolation beds one after the other before it was made fit to enter an adjacent pond.

Had this not been known before the work was started and the plans prepared, the ultimate results would have given rise to much disappointment and the scheme would have been dubbed a failure.

For many years engineers and chemists were content with a good deal less than purification, and at various times during the latter half of the nineteenth century 454 patents were taken out to purify sewage by chemicals, but none of these was effectual. Chemicals are capable of retarding decom-

position, and this may be enough when the effluent is discharged into a great river. They may precipitate solids and reduce colloidal matter. They may help to keep down foul smell. They may even help to promote nitrification, but they cannot effect the change which is essential to insure a stable non-putrefactive effluent. Sewage purification, as, indeed, purification of every impurity, is the special function of the friendly microbe. Without the aid of the micro-organisms it would be impossible to convert or transform organic substances into their inorganic elements. To effect a permanent beneficial change in the composition of sewage it is necessary, therefore, to employ a natural method. It may be done by what the Royal Commission on Sewage Disposal called natural means—that is to say, by land irrigation; or it may be done by artificial means, or bacteria beds; but the choice depends very largely on local circumstances and considerations. The former method requires a greater area, and the latter requires a fall of at least 6 feet between the inlet and the outlet sewers.

I have said enough to show that each case must be considered on its own merits, but assuming a typical case of a country house—

1. Inhabited by ten people.
2. With sewage of average strength.
3. With a total volume of sewage to be treated equal to 30 gallons per person per day.
4. A varying flow fluctuating from nil during the night to a rate equal to a flow of 1,200 gallons per day during the forenoon of an ordinary day.
5. The relative amount of effluent to the water in the stream not more than one to five.
6. The levels suitable to admit of a difference between the affluent and the effluent pipes of, say, 8 feet.
7. The area of land adjacent to the house of average quality and about one acre in area.

Given such conditions I would recommend the establishment of a bacterial plant on the percolation system, consisting of:—

1. A septic or sedimentation tank.
2. A percolation bed.
3. A small sand filter, or other suitable means of removing the humus from the bacteria bed effluent.

The tank is a very important part of the plant. Its main purpose is to digest suspended solids, and so prepare the sewage for distribution over the bacteria bed. It also equalises the flow to the bacteria bed. It is obvious that more sewage flows to the tank at certain times of the day than at other times, and it is desirable to provide sufficient capacity to retain the maximum flow which occurs during the forenoon until the minimum flow which frequently ceases altogether during the night. The tank, therefore, should be constructed so as to provide as far as possible an equal flow to the beds during night and day. It serves still another purpose which has been lost sight of sometimes—namely, that it is the amount of impurity, not the volume of liquid, that counts in the purification process. Domestic sewage is potable water holding in suspension and solution ingredients which do not belong to it as water, and it is evident that at certain times these ingredients predominate in the water to such a degree that an ordinary bacteria bed could not cope with the burden imposed upon it unless the strength of the sewage were proportionate to the purifying power of the bed. The tank, therefore, serves the purpose of equalising the quality as well as the quantity. It acts as a mixing tank and tends to produce a consistent effluent for distribution over the bacteria bed.

The form of a septic or sedimentation tank must depend on circumstances, but for a small tank such as the one under consideration, an oblong form, length about twice its width, and depth from 4 to 6 feet sloping towards one end, will be found the most convenient. It should be watertight and covered by a close-fitting movable cover, and if the levels admit it should have a draw-off pipe at the bottom to facilitate removal of sludge. The settled or septicised sewage should be drawn off at a level that admits of the upper portion of the tank being used to impound the surplus or maximum flow until later in the day, when the flow is greatly reduced. If the installation is large enough to warrant the use of what is called a floating arm, this is easily done; if not, an arrangement for contracting the mouth of the outflow pipe will have to suffice.

The tank I have described may be used either as a sedimentation tank or a septic tank, and the uses I have enumerated are applicable to both. If the sewage is septicised additional advantages obtain in respect of the diminished quantity of sludge to be dealt with, and the tendency which septic fermentation has to kill pathogenic organisms. A disadvantage

of septicising, however, is the foul smell of the tank liquor as it is spread over the bacteria bed.

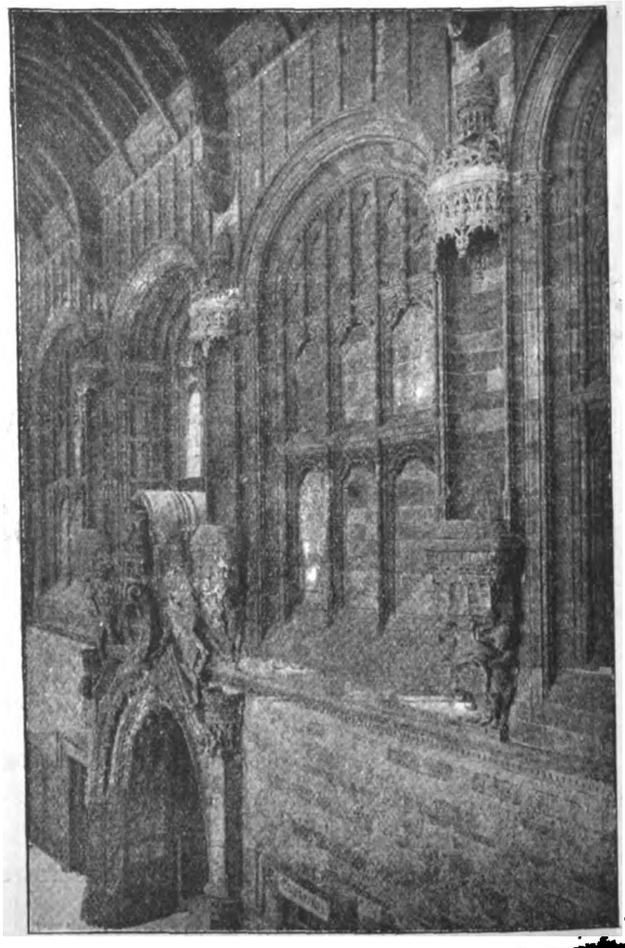
It is difficult to give an intelligible description of what goes on in a septic tank. In the first place, our knowledge is by no means complete; and in the second place, there exists among bacteriologists difference of opinion; but I think I may safely say that there is a great variety of species among bacteria, and that they have different functions to perform according to their kind. One kind of organism attacks and digests one component in the sewage, and another, another, until the whole of the organic matter in the sewage is peptonised, and what has been, from a chemical point of view, a mixture of complex bodies is transformed into a mixture of much simpler substances. In the process of the transformation gases are evolved, and in rising to the surface of the liquid, as they naturally do, they bring with them matters in suspension, which form a tough gelatinous kind of a scum over the surface of the tank. This scum is more readily formed in a covered tank, where the temperature is more equal and invariably higher than in an open septic tank, but in both cases the process and the changes which take place are as nearly as possible identical. The ebullitions of gas are intermittent, but in a large tank appear to be so continuous that air bubbles are constantly rising to the surface and appear like beads floating on the dark water. Where a scum has been formed the water does not have the appearance described, but in joints and cracks of the crust you can frequently see the formation of air bubbles, and where the air is concentrated in this way it is sometimes possible in an open septic tank to produce a flame by igniting the gas, while from a covered tank gas may be drawn off for illuminating purposes and used as a substitute for ordinary coal gas.

One reason for encouraging septic fermentation at this stage of the purification process is that the breaking down of fatty matter and cellulose, which embraces substances like paper, straw, fibre, &c., is very largely due to the action of the liquefying anærobes. Notwithstanding what appears to be an established fact, one cannot forget that the disappearance of leaves which fall every autumn from deciduous trees must be due to an organism essentially different from one whose habitat is in darkness and absence of air.

The sewage having been prepared for further treatment is led from the septic tank to the bacteria bed, which consists of a heap of stones, or other suitable material, placed so that the tank liquor is allowed to trickle from the surface downwards, thus exposing the drops of impure liquor to the action of microbes occupying the interstices in innumerable numbers, and if the action is sufficiently prolonged the impurities are practically destroyed—that is, converted into carbonic acid, free ammonia, and nitrates.

The form of the bacteria bed is immaterial so far as purification is concerned. The largest installations are rectilinear, but the governing factor in the shape or form is the method of distribution of the sewage, and as the fixed spray-jet is the best for a large installation, the bacteria beds are generally rectangular in form. As the rotary distributor is best for small installations, small beds are generally circular in form. A bed, therefore, to deal with only 300 gallons per day would be less than 5 feet in diameter, provided the medium is 6 feet in depth. The floor should be impervious concrete in situ, floated to a smooth surface preferably. On this floor a false floor, consisting of what are called ærating tiles, should be laid to retain the medium and facilitate the free discharge of effluent. The tile floor also forms a means of æration and the ready dispersion of gases, like carbonic acid gas, which inclines to harbour in the bottom of the bed, but the main advantage of a false floor is to facilitate a free discharge of those solids that accumulate in the bed especially after excessive working. If a bacteria bed has been well built and the medium properly selected, particularly as regards size of the pieces employed, the danger of chokage will be reduced to a minimum.

A percolation bed should be a permanent structure that requires no renewal and no displacement for cleansing purposes, and this can be obtained only by the employment of good rock or other hard substance that will not resolve or become friable by the action of water or atmospheric change; other qualities to be aimed at are roughness of surface and proximity to cubical form.



There is nothing better than clean broken stone, but gravel, blue bricks, and hard ball slag, when broken and clean, may be regarded as almost equally permanent. The blue brick tends to break into flat chips in the cracker, and gravel, unless broken, presents too smooth a surface to the bacteria—not that a smooth surface is essentially bad, but it is too sensitive and too readily denuded of the gelatinous substance, harbouring

the bacteria when the flow is increased by reason of rainfall, to be held in high estimation as a medium.

The sizes to which medium should be broken can be decided only after prolonged and careful tests, and a size suitable for one sewage may be quite unsuitable for another.

It may be safely assumed that the smaller the medium the more complete will be the purification obtained, but a bed composed of small medium ($\frac{1}{8}$ inch) costs much more than medium size (1 inch diameter). Then the small medium will not take so much sewage; it will require longer periods of rest, and it will retain on the surface suspended matter which can be more economically dealt with subsequently.

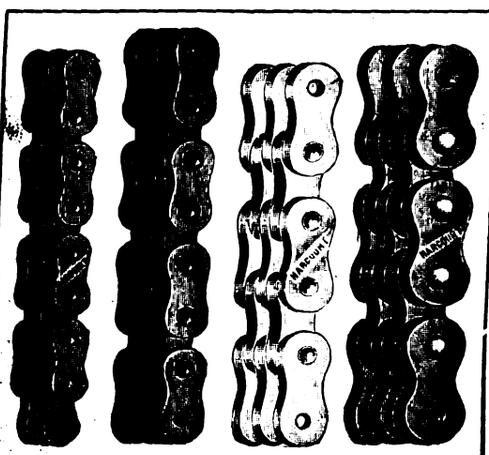
In all sewage there are impurities that are readily eliminated, as gas. There are also impurities that undergo change with extreme slowness, such as colloidal matter, and recent investigations show that there is reason for believing that it is colloidal matter that causes the notorious loss of capacity of contact beds, and constitutes the bulk of the suspended matter issuing from percolation bacteria beds.

I am convinced that there has been a distinct want of knowledge regarding the real nature of the clogging of contact beds, and the more the subject is investigated, the more will it be seen that the safest form of bacteria bed is one which allows the bed to perform the natural function of discharging the matter which is due to the chemical change that must inevitably take place in a sewage containing colloidal matter. Some prefer to eliminate the solids from the sewage before it is applied to the oxidising bed, even if they have to use chemicals for the purpose, but this is not so obviously wise as would appear at first sight; for example, I have known many beds that gave off as filtrate liquid containing more suspended solids than were contained in the sewage applied to them to the extent of 2 or 3 parts per 100,000. For the sewage under consideration a $1\frac{1}{4}$-inch stone medium would be excellent, and should be the same size from top to bottom.

Those who are inexperienced in sewage purification place too much weight upon the appearance of the effluent. This should be guarded against, as a beautiful clear effluent may putrify on incubation. An opaque-looking effluent, on the other hand, with 10 or 12 parts per 100,000 of suspended solids, might pass such a test easily—a test which after all is the chief one to be complied with.

The primary function of the bacteria bed is to convert the ammonias into nitrates and nitrites; therefore to attempt at the same time by using small medium to keep back suspended matter is only to prepare for further trouble. The solid matter appearing after passage through a coarse-grained filter is comparatively easily removed either by passing it over a small sand filter, or by allowing it to flow quietly in small narrow trenches cut in zig-zag form on its way to the nearest stream.

I hope I have not led you to assume that the only form of oxidising bed which is capable of transforming noxious into innocuous matter is the percolation bed, because what is called the contact bed is quite capable of doing the same work in a different manner. It is not so popular as it was, and the statement of the Royal Commission that a cubic yard of medium in the form of a percolation bed is worth much more than the same measurement in the form of a contact bed, will do a great deal to deter engineers from using that form of bacteria bed in the future, unless perhaps where it is possible to purify by means of one contact (two contacts requiring about the same fall as one percolation bed); but I should imagine that that is so rare an event that it would be remarkable.



When my predecessor in this chair stated six years ago, in contrasting percolation beds with contact beds, that the latter were dead, he showed his keen insight into the relative merits of the two systems. He was not quite accurate when he said it, as Sheffield and Leicester have since that time adopted the contact form; but expert opinion undoubtedly favours the percolation bed, and it is because I believe it is the form which should be adopted whenever it is practicable that I have confined my remarks to that method of treatment.

There are many situations where a percolation bed could not be brought into use without resort to pumping, which in the vast majority of cases would be prohibitive as regards cost. I propose, therefore, to show that the next best thing to do is to utilise part of the garden as a sub-irrigation plot, but even here it should be borne in mind that unless the land is suitable as regards quality and area and that it can be drained to a depth of 4 feet, it is improbable that effective purification will take place by this method.

The principle involved in adopting irrigation was formerly believed to be absorption of excrementitious matter, &c., by the soil, and utilisation of the same by crops, whilst the

water freed of its noxious qualities gravitated to the drains. Now we would prefer to say that the action is a complex one; first, the mechanical property of straining slowly through the soil is not an inconsiderable part of the purification process, and the chemical changes that take place, due largely to the biological action of the nitrifying organisms, contribute in an even greater measure to the radical change. The effluent obtained by this process of sub-irrigation, where the conditions are entirely favourable, is excellent, but the difficulty of obtaining favourable conditions is great—so great that land treatment is not so popular as it was. If the land is too porous the liquid passes through unpurified; this is especially so on sandy or gravelly soils overlying rock, and if the available ground is planted with trees the sewage follows the roots and tendrils to the nearest drains, effecting only partial purification. On the other hand, if the soil is stiff like clay, marl or peat, or otherwise too compact and retentive, the water cannot escape readily enough, and the site becomes a swamp. Perhaps the worst cases are where the land is on the chalk or the oolite formations; then there is a tendency for the sewage to disappear too easily by cracks and crevices to some neighbouring well, it may be. But the province of the engineer is to overcome difficulties where they exist, and in the case of a house discharging only 300 gallons of sewage per day, and requiring a plot of land 20 yards by 20 yards, it is possible to overcome even natural disadvantages of site, provided the cost of doing so is not prohibitive. If sub-irrigation is adopted, the tank should be used as a sedimentation rather than a septic tank, and it should be fitted with a syphon or tipper to insure the volume of sewage reaching the extreme limit of the irrigation ground; without one or other of those mechanical appliances the sewage would only reach the extreme end of the pipe-line when baths were being used, thus improperly confining the operation.

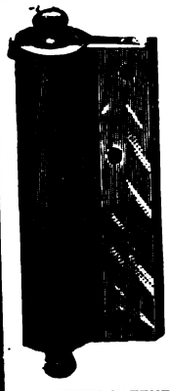
The tank liquor should be conveyed to the land selected by close jointed pipes; there should be branches at stated intervals formed of ordinary unjointed land tiles laid about 12 inches from the surface, and the junction boxes should be supplied with stops for regulating the direction of the flow.

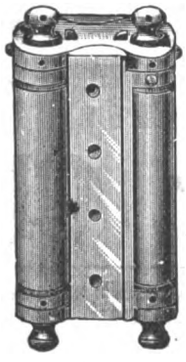
In order to insure the tile pipes being relaid in the same position after they receive their periodical cleansing, it is well to lay them, in the first instance, on a narrow bed of concrete slighfly hollowed to keep the tiles in alignment.

It is necessary to drain the subsoil in the majority of cases, and the drain-pipes should not be shallower than 4 feet from the surface. The number and distance apart must depend on the nature of the subsoil, but it is better to put in too few rather than too many drains in the first instance.

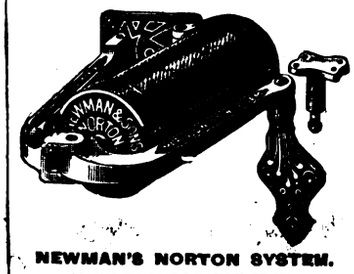
The sub-irrigation pipes are intended to be taken up and cleaned annually, as they are only 12 inches under the surface. This is neither difficult nor expensive, but in many cases it will be found unnecessary to disturb them for years.

The construction of a sub-irrigation plant is simple, but it requires in maintenance what is sometimes difficult to obtain —viz., interest in its successful operation. For instance, if the direction of the flow is not changed whenever there is a sign of overdosing at one place, temporary failure is sure to be the result.





In working this plant it should be remembered that the purification is obtained by the organisms working in the presence of air as in a bacteria bed, and that if air is entirely excluded from the ground by reason of its super-saturation, there will be an immediate drop in the nitric nitrogen contained in the effluent.



The engineer is placed at a great disadvantage in designing work which he will have no control over when it is completed, and both in his own interest and in that of his clients, he should never fail to leave written directions as to its working. I have known the same plant to give good and bad results depending solely upon whether the gardener took any interest in the plant or not.

One cannot, therefore, emphasise too strongly the unwisdom of multiplying small sewage purification plants, when it is possible at a reasonably increased expense to amalgamate with others in establishing a plant large enough to insure efficient management. At a country house this is generally impossible, so that one must expect there, unfortunately, the maximum of expense with the minimum of benefit. Yet the objects are so desirable that the engineer should promote as far as possible simplicity of design, paucity of mechanical devices, and uncomplicated methods of working. He should not hesitate to express with the utmost frankness that there is no system of sewage purification that will work efficiently unless the man in charge takes some interest in his work.

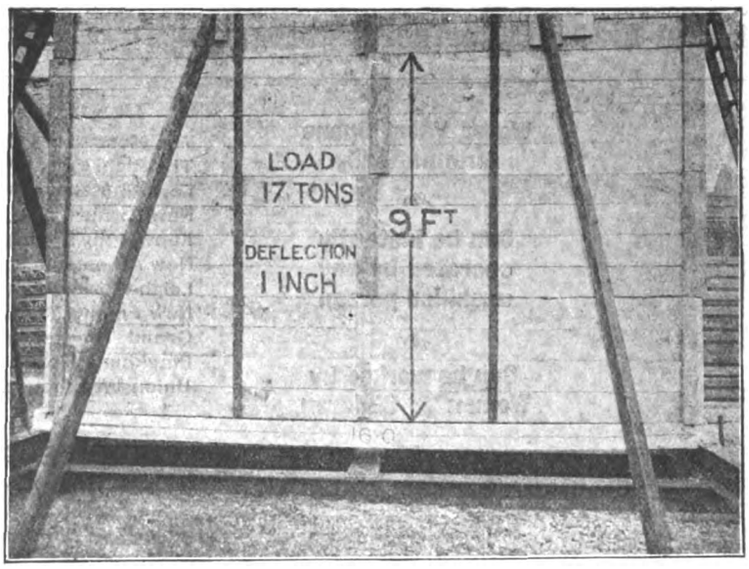
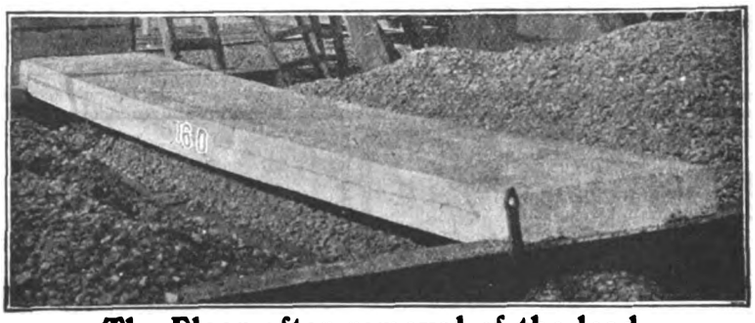
FAWCETT'S MON'LITHCRETE



STEEL GIRDERS

are lattice girders minus compression web members, and in combination with concrete are more than double the strength of joists of equal weight.



For prices per ton and for estimates apply:—

Fawcett Construction Co., Ltd.,

Tunnel Avenue, East Greenwich.

14 cwts. per foot super. on Mon'lithcrete Floor.

The Floor after removal of the load.

Distributed Load in cwts. that one foot will carry at one-fourth the breaking weight—

(63)

Divide by the span in feet and by the working load in cwts. to find the Spacing in Feet.

EXAMPLE.

Span 15 Feet.

Load 1½ cwts. per foot.

15)63·0(4·2
60
30
30
1·5)4·2(2·8
30
120
120

Or about 2′ 9″ to 2′ 10″ Centres.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

Printed by SPOTTISWOODE & CO., LTD., at No. 5 New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, Ludgate Circus, London, E.C.—*Friday, Nov. 26, 1909.*

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

HETTON.—Jan. 1.—The committee of the Working Men's Club invite plans for the erection of a new club. Mr. James Widdowfield, Secretary, Hetton Working Men's Club, Pemberton Street, Hetton-le-Hole.

LARNE.—Jan. 1.—For a technical school proposed to be erected in Victoria Street. A premium of 21*l.* will be paid for the approved design. Mr. Thomas Clearkin, Secretary, Technical Instruction Committee, Larne.

LEEDS.—Dec. 18.—The education committee invite architects practising in Leeds to submit designs for proposed training college for teachers, Kirkstall Grange, Far Headingley. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed to assist the committee. Deposit 2*l.* 2*s.* Mr. James Graham, Secretary for Education, Education Department, Leeds.

MINEHEAD.—Dec. 11.—For a shelter with cloak-room and lavatories, on the beach at Minehead, Somerset, to cost not more than 3,000*l.* Deposit 5*s.* Premium 20*l.* The premiated plans to become the property of the Council; or, in event of the architect carrying out the work, the premium will merge in the commission. Mr. L. C. Webber-Incledon, clerk, 16 Park Street, Minehead, Somerset.

OLDHAM.—Feb. 1.—The Town Council invite competitive designs from architects practising or residing within the borough for an extension of the town hall. Premiums of 50*l.*, 30*l.*, and 20*l.* are offered, together with 5*l.* for every competitor who carries out the instructions. Apply to Mr. E. C. Foote, borough surveyor, Oldham, Lancs.

TRADE NOTES.

WE are informed that the purchase of Messrs. Marsh, Son & Gibbs, Ltd., Bath stone concern by a local company, as recently announced in the Press, did not embrace the whole of the area of the Hartham Park mineral originally leased to Messrs. Marsh, Son & Gibbs, Ltd., as the Yockney and Hartham Park Stone Company, Ltd., comprising several old-established firms, have acquired upwards of sixty acres of this land, where active operations are now being carried on by them.

MESSRS. WILLIAM POTTS & SONS, LTD., clock manufacturers, of Leeds and Newcastle, have just erected new large clock at Messrs. Woollans Bros., Fossgate, York, and a striking clock and bell at Becca Hall, Aberford, and are now erecting a new clock and chimes and illuminated dials at Holmebridge Church, and new hour-striking illuminated clock at Marsden Institute, near Huddersfield; new clock and bell for the new Garden City, Hull, and new clock, chimes, and bells at St. Peter's, South Bank, North Yorkshire. All the above clocks are from the designs and plans of the late Lord Grimthorpe, with all the latest improvements inserted. Messrs. Potts have also just thoroughly cleaned and adjusted Howden Minster clock, East Yorks, erected by them forty years ago.

THE Yorkshire Lawn Tennis Association contemplates the expenditure of 1,500*l.* on the erection of a pavilion at Scarborough in connection with the new courts that are to be laid down on the South Cliff by the Town Council.

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

VARIETIES.

The Salt Union are making preparations for the establishment of extensive new works on the banks of the Manchester Ship Canal at Runcorn.

New coal-mining villages are to be erected at Binley and Wyken, near Coventry, which will accommodate a population of 12,000. At Wyken a beginning has already been made with cottages, and plans are being prepared for 2,000 tenements, covering six miles of streets. Further, it is anticipated that sinkings will be shortly commenced at Whitmore Park, with consequent large building development in Keresley parish.

In many unions in different parts of Ireland it has been found difficult to get contractors for the model plan cottage suggested by the Local Government Board, and adopted by the greater number of district councils, even at the maximum figure allowed. At a recent meeting of the Boyle No. 2 District Council, the engineer, Mr. John M'Donagh, submitted a modification of the plan of the Local Government Board, which, he said, would save about 12*l.* on each single cottage, and therefore make it more likely that contractors would be found. At the last meeting of the Council a letter from the Local Government Board was read sanctioning the proposed modification of the plan.

The Institution of Municipal Engineers held a Council meeting on November 27, when sixteen applications for admission to membership and three for admission to studentship were considered. Eleven applicants were elected to membership and three to studentship. The roll of the Institution now stands at 641 members and 92 students, making a total of 733. The President and the two Vice-Presidents of the Institution were elected as delegates to the Council of the National Association of Local Government Officers. The letter from the Hon. Secretary of the Municipal Engineers' Imperial Defence Committee was considered, and it was decided to refer the whole matter back for further consideration. A number of letters expressing approval of the proposed formation of an associate member class were presented by the Secretary, and further consideration of the matter was deferred. It was decided also to defer consideration of the Secretary's report.

The Paint and Varnish Society will hold their next meeting on the 9th inst., when a general debate will take place on "The Advantages and Disadvantages of Washable Distempers." The debate will be opened by Mr. J. Cruickshank Smith with a general survey of the points at issue, and representative speakers will present the varying views of the manufacturer, the general consumer, the decorator, the designer, the architect and the wall-paper manufacturer. The meeting will be held as usual at St. Bride's Institute, commencing at 8 p.m.

Interest in the controversy between the critics and the German Museum authorities, who have paid some thousands to a Londoner for a wax bust attributed to Leonardo da Vinci, is likely to be renewed by the advent in the auction room of three fine examples of the work of Lucas, by whom the *soi-disant* Leonardo bust is said to have been executed. Undoubtedly an artist of refined skill, Lucas was a *protégé* of Lord Palmerston, and lived near Southampton, where he maintained for many years an intimate friendship with W. H. Rogers, a Justice of the Peace and Mayor of the ancient town. A result of this association was three highly finished medallion portraits of Mr. and Mrs. Rogers and a third one of the Mayor's father. These portraits have never been out of the possession of the family, and are now on view at Messrs. Knight, Frank & Rutley's galleries, where they will be sold by auction on Friday, December 10. They afford pleasant evidence of the artistic ability and restrained feeling so characteristic of the English sculptor.

HOUSES AT HAMPSTEAD GARDEN SUBURB.

These houses are built on the western side of Hampstead Way in the Hampstead Garden Suburb. They were designed by Mr. J. Bruce Merson, M.S.A., architect, 14 Wordsworth Road, Wallington, Surrey, for and built by the Carshalton District Development Company, Ltd. The walls are of brick, finished outside with a red brick plinth up to height of ground floor window-sills and above that covered with rough cast; the roofs are covered with red tiles, and the woodwork of windows and doors generally is painted green.

OZONE.

Although the word "ozone" is derived directly from the Greek word "ozo" (I smell), it is a modern word which was coined to express the peculiar odour produced by the working of an electrical machine. It seems to have been first authoritatively used by Schonbein in a paper read before the British Association in 1840. The substance has ever since proved one of the great problems of chemistry. It was many years later demonstrated that ozone is oxygen in an allotropic state, as a diamond is a form of coke or charcoal. The quantity of it in the atmosphere is very small, being about 3 in 1,000,000; but its efficacy in destroying unwholesome bacteria, micro-organisms and other enemies to health, through its intensely oxidising properties, is extraordinary. Its peculiar properties may be described in the words of a novelist written nearly fifty years ago:—"The aristocratic ozone being absent from the atmosphere, there was a flatness about all the dancing of all those who considered themselves above the plebeian ranks of the tradespeople." Fortunately the production of invigorating and germ-killing ozone and its infusion into a flat, stale and unprofitable atmosphere is within human power. It has for many years been known that if electric discharges are passed through oxygen by means of platinum wires the oxygen becomes ozonified. In 1875 an apparatus called an ozoniser was constructed by Houzeau. Since then other types of ozonisers have appeared.

Within the last few years a company has been at work manufacturing apparatus for the commercial production of ozone for all of its many purposes. Ozonair, Ltd., at their showrooms in 96 Victoria Street, S.W., show generators for the production of ozone for domestic use, medical purposes, water sterilisation, bleaching oils, disinfection of laundries, brewing of beer and other uses. For domestic use there are several varieties of small hanging and standing portable generators for alternating and continuous current supply; when the supply is continuous a converter has to be obtained. The fan, it should be mentioned, can be turned on, if desired, independently of the ozone. Where no public supply of electricity is available a small accumulator or primary battery is employed.

The ozone system of ventilation is considerably more than the mere discharge of that mysterious substance into the vitiated air of a room, as is effected by the machines we have just alluded to. The system consists in drawing in outside air, passing it through a special filtering screen, next through a mixing chamber, where it is further sterilised and then enriched by pure ozone, and it is finally distributed in the various apartments. The mixing chamber may be equipped with a heating or cooling coil. The system is readily adapted to suit special conditions. It has been utilised for several important buildings, including in London the new premises of Messrs. D. H. Evans, Ltd., Oxford Street; the Piccadilly Hotel, part of the Law Courts, Lloyd's, and Messrs. Debenham & Freebody, Wigmore Street; while it has been much employed in the provinces as well as on the Continent, and, in fact, all over the world.

The Normanton Urban District Council, having received the sanction of the Local Government Board to a scheme of main outfall sewerage and sewage disposal, have awarded the contract for the work to Messrs. W. Waring & Sons, Huddersfield. It is proposed to lay several miles of outfall sewers, so as to provide for future building developments. At the disposal works the sewage up to three times the dry-weather flow will be treated with alumino-ferric in three precipitation tanks having a capacity of three-quarters of the dry-weather flow. The clarified sewage is then to be conveyed to a dosing chamber, from which it will flow on to continuous percolating filters at the rate of fifty-four gallons of dry-weather flow per cubic yard of filter. The filter effluent will then pass through sand filters 18 inches deep before discharging into the Waindyke Burn. Screening and detritus tanks are to be provided, and the storm water will be dealt with in two storm-water tanks. The sludge will be raised by pumps driven by oil engines, and dug into the land, five acres of which has been purchased. The consulting engineers are Messrs. D. Balfour & Sons, of London and Newcastle-on-Tyne, and the consulting surveyor Mr. A. Hartley, of Castleford.

THE STANDARD SYSTEM OF MEASUREMENT OF SLATING AND ROOF TILING.

THIS standard system of measurement, as agreed upon by the Council of the Quantity Surveyors' Association and the London Association of Slate Merchants and Master Slaters, was referred to in our Notes and Comments last week, and we have been asked by the London Association of Slate Merchants and Master Slaters to print the terms of the rules in full. The rules are registered at Stationers' Hall and must not be reprinted from our paper.

Slating.

Superficial.—A superficial measurement of the slating to be given representing the net area covered after deducting all openings containing 4 superficial feet and over. The slating to sides of mansard roofs and vertical slating to dormer cheeks, gables, &c., to be similarly measured but given separately. Circular slating to be similarly measured and given separately with radius of slating and any other special description. The description of slating to conical, octagonal, or other turrets to state the diameter at the base and apex and the height of roof. The description in all cases to state the kind and size of the slates, length of lap, method of fixing, and the kind and number of nails to each slate, and if to include for torching or bedding.

Eaves.—A lineal measurement of all eaves to be given as "extra to eaves course," and to state (when required) to be bedded in cement. When the eaves are raking or cut to suit the fall of gutters, the above description to be supplemented by the words "to falls including cutting and waste."

Verges.—A lineal measurement to be given as "extra to verges," and to state (when required) (1) whether slates of slate and half width are intended to be used; (2) whether an extra under or cloak course is to be fixed; and (3) if the item is to include for pointing to the edge in cement. NOTE: When the verges are on skew the above description to be supplemented by the words "on a skew including cutting and waste."

Top Edge of Slating.—A lineal measurement of all top edges of the slating to be given as "cutting and waste to top edge of slating," and this is also to be given under sills of dormers, lanterns, skylights, and against lower sides of chimney stacks, and all other openings which occur in the slating.

Square Abutments.—A lineal measurement of all cuttings of slating to be given as "cutting and waste to square abutments," and to be given where the slating abuts against the sides of all chimney stacks, dormer cheeks, skylights, and other openings. Where the slating is executed between two parapet walls similar cutting is to be measured at one end of the roof only.

Cuttings.—A lineal measurement of all cuttings against skew abutments to be given as "raking cutting and waste to skew abutments." A lineal measurement of all circular cuttings to be given as "circular cutting and waste."

Valleys.—A lineal measurement on both sides of all valleys to be given as "cutting and waste to sides of valleys (both sides measured)."

Hips.—A lineal measurement on both sides of all hips where coverings are used to be given as "cutting and waste to hips (both sides measured)." A lineal measurement of all mitred hips to be given as "extra to close cut and mitred hips and including cutting and waste on both sides," if pointed to be so described.

Ridges.—A lineal measurement of tile or slate ridges and hips with description to be given, and all cut and splayed ends separately given. All mitres and intersections to be numbered and fully described.

Roof Tiling.

Superficial Measurement of Tiling.—A superficial measurement of the tiling to be given representing the net area covered after deducting all openings containing 4 superficial feet and over. The tiling to sides of mansard roofs and vertical tiling to dormer cheeks, gables, &c., to be similarly measured but given separately. Circular tiling to be similarly measured and given separately with radius of tiling and any other special description. The description of tiling to conical, octagonal, or other turrets to state the diameter at the base and apex and the height of roof. The description in all cases to state the kind and size of the tiles, the lap to which they are to be laid, the method of fixing, the kind and number of nails or pegs to each tile, and if to include for torching or bedding.

Eaves.—A lineal measurement of all eaves to be given as "extra to eaves course," and to state (when required) to be bedded in cement. When the eaves are raking, or cut to suit

the fall of gutters, the above description to be supplemented by the words " to falls including cutting and waste."

Verges.—A lineal measurement of all verges to be given as " extra to verges," and to state (when required) (1) whether tiles of tile and half width are intended to be used ; (2) whether an extra under or cloak course is to be fixed ; and (3) if the item is to include for pointing to edge in cement. NOTE : When the verges are on skew the above description to be supplemented by the words " on skew including cutting and waste."

Top Edge of Tiling.—A lineal measurement of all top edges of tiling to be given as " cutting and waste to top edges of tiling," and this is also to be given under sills of dormers, lanterns, skylights, and against lower sides of chimney stacks, and all other openings which occur in the tiling.

Square Abutments.—A lineal measurement of all cuttings of tiling to be given as " cutting and waste to square abutments," and to be given where the tiling abuts against the sides of all chimney stacks, dormer cheeks, skylights, and other openings. Where the tiling is executed between two parapet walls similar cutting is to be measured at one end of roof only.

Cuttings.—A lineal measurement of all cuttings against skew abutments to be given as " raking cutting and waste on tiling to skew abutments." A lineal measurement of all circular cuttings to be given as " circular cutting and waste."

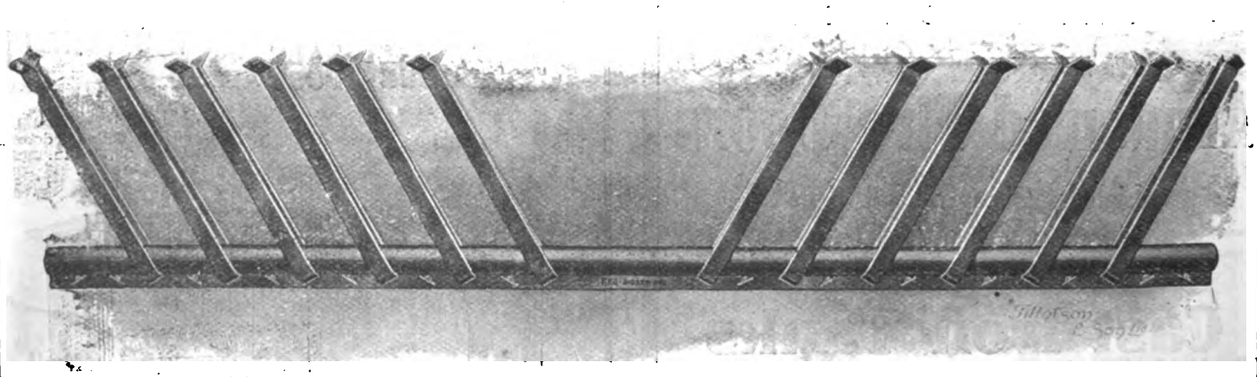
Valleys.—A lineal measurement on both sides of all open valleys to be given as " cutting and waste to sides of valleys (both sides measured)," if bedded and pointed to be so stated. Where valley tiles are used a lineal measurement to be given as " extra to valley tiles to suit pitches of roof, including cutting and waste and bonding on both sides."

Hips and Angle Tiles.—A lineal measurement on both sides of all hips where coverings are to be used to be given as " cutting and waste to hips (both sides measured)." A lineal measurement of all mitred hips to be given as " extra to cut and mitred hips, and including cutting and waste on both sides," and if pointed to be so described. Where, in the place of coverings, hip tiles (or angle tiles for vertical tiling) are used, a lineal measurement to be given as " extra to hip tiles to suit pitches of roof (or angle tiles for vertical tiling) including cutting and waste and bonding on both sides."

Ridge Tiles.—A lineal measurement of ridges with description to be given, and all cut or splayed ends separately given. All mitres, intersections, special made tiles and finials to be numbered and fully described.

INSTITUTION OF MUNICIPAL ENGINEERS.

A VISIT of the Institution of Municipal Engineers was made on Saturday last to the Surrey Commercial Dock, under the conduct of Mr. J. Davies, of the *Timber News*. The visit lasted some two hours. A variety of woods were inspected, and their respective merits and demerits clearly explained and demonstrated by Mr. Davies. The visit was a most interesting and a most instructive one, and those who were present look forward to the further visit which Mr. Davies has promised to pioneer to inspect the harder varieties of wood. These could not be seen on Saturday, as they are stacked in docks removed some distance from the Surrey Commercial. A unanimous vote of thanks was passed to Mr. Davies on the conclusion of the proceedings.



The following are brief " notes " of the points conveyed by Mr. Davies during the tour of inspection, and they will be found of more than usual value, owing to the fact that much of the information conveyed is not to be found in the ordinary text-book.

Red or Yellow Fir or Deal.—Commonly termed " red " in the North and Midlands, and " yellow " in the South. A European wood, quite distinct from yellow pine or red pine, both of which are American woods. The staple building wood. Used for both joinery and carcassing or constructional work. Strong, durable, and economical in conversion, but not obtainable without some measure of defect, in the form of shakes, sap, and knots. Exported from Russia, Sweden, and Norway. Best shipments are from Archangel, Petersburg, Gefle, Sandarne, and Hudikswall. Archangel and Petersburg wood is hammer-stamped on the ends by shippers. Swedish and Norwegian are marked in coloured paints. The white paint figures seen on ends are dock company's marks, referring to size, name of ship, and rotation number of voyage, and have no bearing on quality. Once imported in logs, but now in sawn planks, deals, and battens, and planed and unplaned boards.

Avoid uncertainty and worry by insisting on your Concrete being reinforced with

The PERFECTOR TRUSSED BAR

the only Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.

The only system which is proof against the carelessness of workmen.

The Perfector Bar Reinforced Concrete Co.,

Telegrams: "[illegible], LEEDS." STANDARD BUILDINGS, LEEDS.

Digitized by Google

White Fir or Deal.—Exported from same districts as red or yellow deal. Not quite so durable as yellow, but well adapted for interior fittings, &c., where a plain, cheap wood, without figure, will do. Used for small buildings in the North and Midlands, but rarely or never for contract constructional work. Largely cut up into packing-case stuff. Sapwood is not easily distinguishable from heart. Does not shake or crack so readily as yellow.

Yellow Pine.—The mildest and cleanest of the American pines. Never used for stress bearing work, but excellent for joinery. Remains very sound in seasoning and does not warp. It is prized, therefore, for engineers' pattern making. Best qualities very free from sap and knots. Easily distinguished by its soft mild grain, its even yellow colour, and the tiny dark hair-like marks which are visible in abundance on planed surfaces. Imported from Canada and Newfoundland in sawn planks, deals, and boards. Best shipments are from Quebec and Montreal. Sometimes shipped in the log.

Red Pine.—A sound, durable building wood, adapted for both joinery and carcassing. Very similar in appearance and quality to red or yellow deal or fir. Shipped from Canada in planks, deals, and boards.

Pitch Pine.—Next to red fir, the most largely used wood for engineers and builders. Strong, tough, and durable. Imported from south-eastern United States in logs, planks, deals, and boards. The staple wood for large scantlings in roof timbers, &c., having superseded the now almost extinct shipments of red fir logs from Memel, Dantzic, and Riga. Where sizes required are less than 4 inches by 12 inches, however, it offers no advantages over red fir or deal, which is available in numerous dimensions, ready sawn, within that limit. Very useful for joinery, being obtainable in clear sound boards up to 12 inches and 14 inches wide. Has good figure, giving bold effect at moderate cost.

Oregon or British Columbian Pine (Douglas Fir).—A very useful carpenters' and joiners' wood, closely resembling pitch pine. Shipped from British Columbia and the State of Oregon. The same wood, in spite of difference in title. Very free from sap, and can be obtained by selection equally free from knots. Shipments include a few very wide ringed or spongy planks and logs of doubtful durability; but when these are removed the remainder can be used without hesitation for all purposes where red fir or pitch pine would do. Imported in logs and large sawn planks, the latter ranging up to 8 inches thick and 18 inches wide, giving great economy in conversion. Is receiving increasing recognition from architects.

White Spruce.—Closely resembling European white fir or deal, both in appearance and behaviour under the tool. Not regarded as a building timber, except for small and cheap buildings in the North and Midlands. The better qualities are very clean and sound, showing smooth, silky surface when planed. Useful for interior fittings, oars, sculls, &c. Imported in sawn planks and deals from Canada. Best shipments are from Quebec and Montreal.

Larch.—A very tough, durable building wood, imported from the White Sea district of Russia in logs and sawn planks, deals, and boards. Hard to work, but strong. Not unduly sappy or knotty. Can be used anywhere as a substitute for red fir, pitch pine, or Oregon pine in constructional work. Has marked yellow or bilious tint. In appearance something between red or yellow deal and pitch pine. Largely grown in England for telegraph poles. Smaller sizes used for fencing, farm buildings, &c.

THE electric lighting committee of Edinburgh Town Council have ordered to be printed a preliminary report by Sir Alexander Kennedy as to the future working of Dewar Place and M'Donald Road power stations, with special reference to the provision of cooling towers. The scheme for Dewar Place may cost 45,000*l.*, and includes the provision of two exhaust turbines and towers.

THE water committee of the Birmingham Corporation report that the subject of the risk of damage to the Elan Valley works by lightning has from time to time engaged their attention, and in view of the possible serious effects of electrical explosion in the heart of the dams, they considered it prudent to seek expert advice on the subject. Sir Oliver Lodge was consulted, and he, after an inspection of the works, recommended the adoption of certain protective measures, the details of which have been worked out by Mr. Macaulay, the Elan supply resident engineer, in conference with Sir Oliver Lodge, and the work has been put in hand, the estimate being 770*l.* for the whole of the works.

A HOUSING AND TOWN-PLANNING CONFERENCE.

A conference on the practical administration of the town-planning clauses of the Housing and Town-Planning Act will be held on Tuesday, December 14, at 10 a.m., and Wednesday, December 15, at the Westminster Palace Hotel, London, S.W., under the auspices of the National Housing and Town-Planning Council.

The Council in their circular say that as both Houses of Parliament are now in agreement in regard to the Housing and Town-Planning Bill, they are calling together the postponed conference on town-planning procedure. The principles of town planning were adequately dealt with at the National Town-Planning Congress held in August last, and as copies of the valuable papers read at this Congress will be sent to every representative appointed to attend the coming conference, there will be no need to cover this ground again. It is recognised that the best form for the conference to take will be the full and careful discussion of the subject by the representatives themselves.

The Council propose to place before the Congress as the basis for discussion a series of suggestions as to the most practical lines of town-planning procedure adapted to (*a*) great centres of population; (*b*) urban districts.

The following gentlemen have been invited to co-operate in the preparation of this series of suggestions:—

Professor S. D. Adshead, Professor of Town Planning, Liverpool University; Mr. John H. Barlow, Bourneville Village Trust; Professor Berlepsch-Valendas, Munich; Mr. Albert E. Cave, London; Professor Eberstadt, Berlin; Professor Fuchs, Tubingen; Professor Patrick Geddes, Edinburgh; Ober-Baurat Geusen, Düsseldorf; Mr. E. M. Gibbs, F.R.I.B.A., Sheffield; Mr. T. C. Horsfall, Manchester; Mr. Percy B. Houfton, architect, Woodlands Colliery Village; Mr. T. H. Mawson, Windermere; Beigordneter Rehorst, Cologne; M. Augustin Rey, Paris; Mr. B. Seebohm Rowntree, Earswick Village Trust; Mr. Raymond Unwin, Hampstead Garden Suburb; Oberbürgermeister Wagner, Ulm; Mr. Percy Scott Worthington, F.R.I.B.A., Manchester.

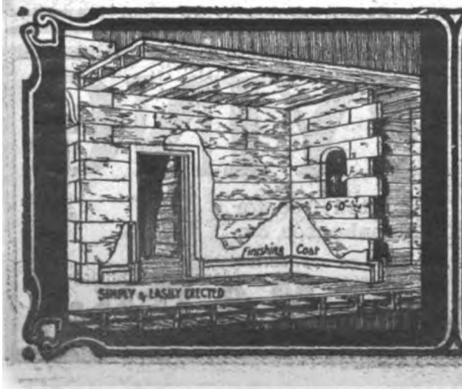
The suggestions of these gentlemen will take the form of a skeleton plan setting forth the best course for a local authority to take in the administration of the new Act. These suggestions will be printed and placed before the representatives at the meeting.

Before the close of the conference arrangements will be made for the formation of a town-planning advisory committee, in accordance with the following resolution of the Congress held in August last:—

"This Congress approves the appointment of a special town-planning advisory committee for the purpose of carefully watching the framing of the methods of procedure and the administration of the Housing and Town-Planning Bill when it is passed into law.

"It suggests that, in addition to representatives of the National Housing Reform Council, each county, city, borough and local council and society subscribing to the Council, or which has sent representatives to this Congress, appoint a representative on the committee. It also desires to ask the foreign delegates present to give the benefit of their experience and advice for the assistance of the proposed committee.

"It further suggests that the committee so formed should be requested to appoint sub-committees for dealing with the various details of organisation and procedure, and shall include a special sub-committee for Scotland."



The gentlemen named above are being asked to act as members of this advisory committee, and to give this committee the benefit of their skilled advice. This town-planning advisory committee will, it is trusted, be of service in answering questions and publishing papers and plans relative to town-planning schemes, and especially schemes in other countries.

An abstract giving the clauses of the new Act, and describing their scope, will be sent to all the representatives in the week preceding the Conference.

A detailed statement of the actual procedure adopted by German cities will also be placed before the Conference, and arrangements will be made for a number of the most valuable town plans of Germany and France to be exhibited and explained.

LIFTING.

The modern practice of Engineers and the experience of users demonstrate that **HYDRAULIC POWER** is the safest and most reliable and cheapest in the end.

The use of the public supply of **HYDRAULIC POWER** for **LIFTS, CRANES, CAPSTANS, PRESSES, EJECTORS, FIRE INJECTOR HYDRANTS,** and **ARTESIAN WELL PUMPING GEAR,** is constantly increasing, not only in London, but in Liverpool, Hull, Manchester, and Glasgow.

Everyone interested should read

"HYDRAULIC *v.* ELECTRIC POWER FOR LIFTS"
(2nd Edition).

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

CORDWAINERS' HALL.

THE new hall which is being built for the Cordwainers' Company at 7 Cannon Street, E.C., has a frontage to Cannon Street of 62 feet, and has a depth of 60 feet or thereabouts, and is the sixth hall built upon the same site, the first hall having been built in or about 1393.

The new building provides for an entrance to the hall premises at the western end of the site, leaving the rest of the frontage to Cannon Street, by a depth of over 30 feet, for letting purposes on the ground and basement floors. This part of the premises will be self-contained and quite distinct from the rest of the premises to be occupied by the Company.

The entrance hall is octagonal on plan, and is to be finished in marble, and leads to an inner hall, from which the main staircase ascends to the upper floors. At the foot of this staircase cloak-room provision has been made, and an electric lift provided to serve throughout the premises.

The mezzanine floor will contain a suite of offices for the use of the clerk of the Company, a large committee room, and also an office for the beadle. The first floor will contain the court room and the court reception room, while on the second floor the large hall is situated. This hall will be 60 feet in length by 32 feet wide and 23 feet high. On the top floor accommodation is provided for the beadle and a kitchen to serve the large hall.

The front elevation is treated in English form of the Renaissance, with very little ornamentation. The front is dealt with in two heights, the lower being rusticated and containing two floors, the ground and mezzanine, and the upper portion containing the court rooms and hall, where an Ionic order is used, running through the two floors and terminating with an open balustrade. The entrance doorway is to be executed in grey polished Aberdeen granite.

The whole of the premises are being built with fireproof construction and will be heated with low-pressure hot water throughout.

The builders for the works are Messrs. Ashby & Horner, of 8 Aldgate, E. Mr. W. Crossley is acting as the clerk of works, and the building is being carried out from the designs prepared by the company's surveyor, Mr. H. Chatfeild Clarke, F.R.I.B.A., of 63 Bishopsgate Street Within, E.C., under whose personal supervision the works are being executed.

TRADE NOTES.

UNDER the direction of Mr. J. Turner, surveyor, the "Boyle" system of natural ventilation embracing the latest patent "air-pump" ventilators and air inlets, has been applied to the town hall, Matlock.

THE tower of the parish church, Dartford, Kent, is being restored and a new clock with chimes is being erected. It will have two 6-foot illuminated dials, play the Westminster chimes on four bells and strike the hours on the largest bell in the tower. The tender of Messrs. John Smith & Sons, Midland Clock Works, Derby, has been accepted.

THE municipal authorities of Antwerp invite tenders for the supply and fitting of shower baths in the municipal buildings in the Rue des Prédicateurs and the Rue de la Ferme at Antwerp. The cost of the work is estimated at about 946*l.*

MESSRS. E. H. SHORLAND & BROTHER, the Manchester Stove Works, Failsworth, Manchester, are carrying out the following works:—The Empire Theatre, West Hartlepool, is being ventilated by means of their patent exhaust roof ventilators and special inlet ventilators. The extensions to the Wallsend and Willington Quay fever hospital are being warmed and ventilated by means of double-fronted patent Manchester stoves with descending smoke flues and patent Manchester grates. The additions to Haines Hospital, Ramsgate, are being warmed and ventilated by means of patent Manchester grates and ventilators. The smallpox hospital, Redbourn, is being warmed and ventilated by means of patent Manchester grates.

THE Metropolitan Electric Supply Company have opened new show rooms at 15 Porchester Road, Bayswater. The decorative scheme has been carried out under the direction of Mr. A. W. Neal (the inventor of "Coatostone"), of 77 Mortimer Street, W. The decorations are simple and effective, as harmony of the delicate colours has been studied; the ceiling is finished in ivory white, the frieze in cream "Coatostone," the wall panels in mauve "Coatostone," and styles and rails and cornice in ivory white finished egg shell gloss. The front portion of shop walls is in "Coatostone" imitating ashlar work of Bath stone with dental cornice and panelled soffits with fluted Greek columns and ornamental caps and bases.

VARIETIES.

THE Wolverhampton Corporation have applied for the 15,000*l.* required for extensions to their electricity works and mains.

THE Birmingham Building Trades' Exchange and Club, Ltd., had their first annual dinner at the Imperial Hotel on the 2nd inst. The club has now a membership of 250.

AT Folkestone more building plans were passed during November than in any previous month of 1909. The number of empty houses has decreased by over one hundred since last year.

THE Torquay Corporation are going to promote a provisional order to empower them to proceed with schemes for the simultaneous erection of new municipal buildings, a town hall and a pavilion.

THE King's Norton Urban Council have decided to make application to the Local Government Board for permission to borrow 26,600*l.*, to cover the cost of the erection of the Grove Road school and alterations to the King's Heath and Silver Street schools.

THE Stone Urban District Council have approved the plans submitted by Mr. Commin, the Council's engineer, for new sewage disposal works and refuse destructor at an estimated cost of 8,193*l.* The work will be proceeded with as soon as the necessary authority is given.

MR. C. F. WIKE, the city engineer for Sheffield reports that in the last year the number of new houses certified for occupation was 1,723. It is estimated that there are now 106,135 houses in Sheffield, of which 52,425 have been built under the by-laws since 1864..

A SPECIAL meeting of the Matlock Bath District Council was held on Saturday to consider tenders for the erection of a kursaal and pumproom, to complete the 50,000*l.* improvement scheme sanctioned by Act of Parliament. After an hour's consideration, in camera, the press were informed there had been about a score of tenders received, and the Council had chosen that of Messrs. W. Ford & Sons, of Derby, at the sum of 8,694*l.*, the buildings, &c., to be erected and completed in seven months.

THE Paisley Dean of Guild Court last week passed the following plans:—James Cochrane, wine and spirit merchant, to erect shops at the corner of Canal Street and Stow Place; J. & J. M'Callum, dyers, to construct a new warehouse at the works at Laighpark; Wilson & Co., joiners, to erect a tenement of dwelling-houses at Barterholm Street; Brown & Polson, starch manufacturers, to re-erect the buildings which were recently destroyed by fire at Carriagehill; Thomas Stevenson, builder, to form a new street between Clark Street and Greenhill Road.

THE electrical engineer to the Horsham Urban Council reports that there is a considerable amount of amateur electric wiring going on in the town in the way of extensions to existing installations. The work is done without notice to him, and therefore is never tested, and there is the possibility that a meter may be burnt out through having too much load upon it. This work is usually carried out with the cheapest of materials and in utter disregard of the Council's wiring rules, so that although the Council could not be blamed if a fire occurred, the undertaking would suffer from the scare that would be caused. In consequence the electrical engineer has been authorised to insist on the Council's regulations as to notice and wiring being complied with, and in case of non-compliance, to exercise his power of cutting off the supply.

EXCEPTIONAL facilities are offered by the Great Eastern Railway Company's British Royal Mail Harwich-Hook of Holland route for visiting Holland and Germany during the Christmas holidays. Passengers leaving London in the evening, and the northern and midland counties in the afternoon arrive at the principal towns in Holland the following morning, Cologne at noon, Berlin, Dresden and Bale in the evening. Tickets at reduced fares will be issued to Brussels via Harwich and Antwerp, December 21, 22, 23, 24 and 27, available for eight days. Tickets dated to suit the convenience of passengers can be obtained at the Continental Inquiry or booking offices Liverpool Street station. The Danish Royal Mail steamers of the Forenede Line of Copenhagen will leave Harwich for Esbjerg in connection with express trains to Copenhagen, on Thursday, December 23, and Saturday, 25th; returning Tuesday 28th and Wednesday 29th. The General Steam Navigation Company's steamers will leave Harwich for Hamburg Wednesday, December 22, and Saturday, 25th; returning Wednesday, 29th.

A CASE OF LIBEL.

THE Lord Chief Justice, sitting with a special jury in the King's Bench Division on Monday, heard an action for damages for libel brought by Mr. Sidney Robert James Smith, F.R.I.B.A., against Mr. W. I. Dowle, a surveyor.

Mr. Walter Frampton, counsel for the plaintiff, said the defendant was not represented nor was he present in court; in fact he believed that he had left the country and taken with him all his belongings. He would ask the jury to take that into consideration after they had heard all the facts of the case. It appeared that in 1903-4 Messrs. Jennings and Messrs. Doulton successfully tendered for the reconstruction of drainage in the Elder Road Schools and Brook Street Infirmary, in the Lambeth district, and Mr. Smith was appointed by the Lambeth Board of Guardians as architect. Defendant was in the employ of Messrs. Jennings as a work supervisor, and was dismissed from his employ because of his having committed certain irregularities, which had, however, nothing to do with the case. The libel complained of was contained in a letter which the defendant wrote to Mr. A. F. Collins, a member of the Lambeth Board of Guardians, four years after the contracts were completed. It was as follows, having been written from Dover:—

"Dear Sir,—Knowing you as ex-Chairman of the Lambeth Guardians, and noticing in the *Builder* that the firm of Jennings were the lowest tendering in competition for some sanitary works at Wincott Street Casual Wards, it occurred to me as a very suspicious circumstance knowing as I do that for every public work in competition for the last eighteen months they have been highest every time in their tender, and perhaps the same conclusion might occur to you when I have related the circumstances of the last contracts with your Board at Elder Road Schools and Brook Street Infirmary. I do not know if the same architect as you employed then is still on your list, for if so he will go out of his way to do anything for Jennings. At Elder Road and Brook Street the architect and surveyors each took 100*l.* from Jennings, and the clerks of works also shut their eyes and received bribes from the same source. Jennings systematically robbed the Board in the following manner with the assistance of the architect, surveyors and clerks of works:—(1) By measuring and charging for materials never supplied or used; (2) by gross overcharges on every item not scheduled; (3) by falsification of their weekly day work sheets, and by irregular procedure in these same sheets being allowed to leave the works before being scrutinised and passed by the proper authority, the clerk of works. I am in a position to know that by these methods they received more than 1,200*l.* at the school works than they were entitled to; also when the Brook Street works were tendered for, Jennings were the only firm invited by the architect to give an estimate for the work and fittings, and the same methods of increasing their day work sheets by the assistance of the clerk of works was maintained throughout. At Elder Road School, on a schedule form of contract, you will find the day work allowed by the architect and surveyors amounted to nearly 25 per cent. of the whole of the amount you paid the contractors for the work they carried out for you. This, I am sure from my knowledge of the contract business, is most unusual, and if your architect and staff had done their duty to your Board those charges could have been limited to a very small proportion of the whole."

That letter, said counsel, meant to convey that Mr. Smith had failed to efficiently discharge his duties to the Guardians, and that he had acted dishonourably, unprofessionally, and corruptly in his office. As there was no foundation whatever for such allegations, Mr. Smith wished for a judgment which would put him right in the eyes of any who had heard of the libel and the charges it contained. Counsel added that the other persons concerned in the letter had instructed their solicitors, but the allegations against them had been withdrawn by the defendant.

Mr. Smith, in the witness box, said he had been architect for the Tate Gallery, the National Gallery, the Cripplegate Institute, and many other public places. He absolutely

denied that there was any truth in the allegations made by the defendant.

His Lordship then addressed the jury, remarking that there was nothing worse in the present day than a libel of that sort to injure the character and reputation of a professional man. Defendant had put in no plea of justification, but had apparently left the country, so that there being no doubt as to the falsity of the libels for which there was absolutely no foundation, all the jury had to do was to assess the amount of damages which the plaintiff should receive to compensate him for the pain and trouble he had been put to by its publication.

The jury awarded the plaintiff 100*l.* damages, and his Lordship entered judgment for that amount, with costs.

HOT-WATER SUPPLY SERVICE INSTALLATIONS.

A dispute recently arose in connection with the erection of the new Masonic Hall, Leicester, to which allusion was made in our issue of November 12. It may be remembered that the plumbers claimed the monopoly of pipe-fitting and fixing work in all metals (whether lead or not). After protracted delay the plumbers agreed to join in an application to the Board of Trade to appoint an arbitrator to hear and determine the question of dispute between the parties. Alderman T. Smith, J.P., was appointed to act as arbitrator, and heard the case in Leicester on November 5 and 6, the parties represented being Messrs. Ashwell & Nesbit, Ltd., the heating and domestic engineering contractors; the Masters' National Association and the Operatives' National Union connected with this trade on one side, and the plumbers' section of the Leicester and District Building Trades Employers' Association and the United Operative Plumbers' Association (Leicester District) on the other side.

At the termination of the proceedings the arbitrator reserved his award.

The decision of Alderman T. Smith, J.P., has now been issued and is as follows:—

"I decide that no claim has been established giving to plumbers the exclusive right to fit and fix all pipes and fittings in hard metals used in connection with ventilation, heating, warming, laundry, cooking, and general hot and cold-water, domestic (or other) supplies or services.

"I therefore award and determine that, in the water area of the Leicester Corporation, the demarcation of work shall be as follows:—

(*a*) "All lead work in connection with hot- and cold-water domestic (or other) supplies or services shall be plumbers' work.

"All domestic waste, soil or ventilating pipes above ground from w.c.'s, baths, lavatories, sinks, or other sanitary conveniences or appliances, shall be plumbers' work.

(*b*) "All other work in connection with ventilation, heating, warming, laundry, cooking and general hot- and cold-water domestic (or other) supplies or services, in which iron, brass, copper, or other similar hard metal is used, may be done either by hot-water, heating and ventilating engineers, fitters, or by plumbers, as may be provided in plans or schemes prepared by hot-water, heating and ventilating engineers, or by master plumbers, or others."

This completely vindicates the right of the heating and domestic engineers to do the work in question and establishes what they have maintained all along, viz., "That all lead work be considered plumbers' work, but that a neutral line be taken as regards all iron, brass, copper, or other metal work, which may be executed by engineers or plumbers." The plumbers' contention that, irrespective of the metal used, the work is theirs and theirs alone, to the exclusion of any other trade, is entirely set aside and disposed of.

MUNICIPAL AND HEALTH EXHIBITION.

A meeting of the Advisory Council of the Municipal and Health Exhibition, 1910, was held on Wednesday, the 1st inst., at the Holborn Restaurant. The chairman of the council (Professor Henry Adams, M.Inst.C.E.) presided, and there was a representative attendance of local government officers and the heads of manufacturing firms.

Mr. F. W. Bridges, organiser of the exhibition, stated that since the last meeting a good deal had taken place, and he had the satisfaction of telling them that on the Honorary Advisory Council they now had 120 gentlemen from all parts of the country, principally municipal engineers and sur-

veyors, &c. The first exhibition, last year, gave an idea of what a municipal exhibition should be and what it could do. The interest taken in the movement was widespread, and for that reason the committee work must largely be in the hands of those nearer London, but every member would be informed periodically of all that was taking place, and cousulted upon any difficulties which might arise. Among the numerous offers of assistance received he was glad to announce a letter from Mr. G. L. Gomme, the clerk to the L.C.C., who said that if his experience would be of any use they could command him at any time. Mr. Bridges thought it was essential that they should keep well before them the dual object of the exhibition. On the one side it was to enable municipal engineers and other officials, and the councillors themselves who were responsible for the efficient municipal government of the country, to be kept *au fait* of everything that appertained to their respective departments, both as regards external and internal work. On the other side the great object of the exhibition was to educate the public as to what the municipal authorities were doing, as to what the money was wanted for.

It was decided to invite the President of the Local Government Board to consent to become president of the exhibition.

It was agreed to send a letter to all local authorities inviting their co-operation and asking them to send delegates, and that technical schools should be asked to submit specimens of the pupils' work.

Conferences and lectures are to be arranged for. Those in the afternoons will be of a more technical character, while popular lectures will be given in the evenings to interest the general public in matters pertaining to local government. The names of Professor Sylvanus Thompson and Mr. Sydney Webb were suggested.

The metropolitan boroughs are to be asked to grant facilities for delegates to visit public works and institutions—the Rowton Houses, Hampstead Garden Suburb, &c.

It was decided to ask the Lord Mayor of London to open the exhibition and to have a "Corporation Day."

In addition to the sections already announced, it was decided to include fire prevention, first aid and ambulance, physical training and ambulance.

APPRENTICESHIP AND TECHNICAL EDUCATION.

A CONFERENCE on "Industrial Education and Apprenticeship" was convened on Friday by the Lord Mayor at the Mansion House. The particular purpose was to discuss the question of industrial training in education and the development of trade schools, and in connection therewith (1) the position of apprenticeship and of the apprenticeship charities; and (2) the establishment or development of employment bureaus or other means of bringing those leaving school into touch with the industrial and commercial world. It was felt by the promoters that much good would be done by securing the sympathy of employers of labour and industrial associations in the work which the London County Council has undertaken in connection with the establishment of trade schools, into which are drafted boys and girls between the ages of thirteen and sixteen, for a course of training which, while not neglecting the educational side, has nevertheless a strong industrial bias.

The Lord Mayor in opening the proceedings said that it gave him great pleasure to preside at a meeting which was concerned with industrial education in London and apprenticeship. He took a particular interest in the subject of apprenticeship, and when he was asked to convene a meeting for that afternoon he at once assented. Owing to the large number of speakers, he said he would be forced to limit the speeches to seven minutes each.

Mr. Cyril Cobb, the vice-chairman of the London County Council education committee, said that before he dealt with his subject he wanted to thank the Lord Mayor for giving the education committee an opportunity of saying what they had on their minds. The great reason for the conference was the general unrest that was felt as to the tendency of our present educational system, and as to whether it was having the effect that people wished it to have. It was believed that England's commercial supremacy was threatened by the leading commercial nations of the Continent, and by the United States. The reason often put forward was that their education was on a better industrial and commercial basis and especially in the matter of those intermediate and provisional schools which form a link between the elementary school and the universities. Therefore the education committee and the nation wished to see how they stood. In the first place he

would say that if they wished to reform they should make their education more practical. But there was a tendency to abuse rather unfairly our own system and to praise that of rival nations. While not falling into this error, he would say that there were some practical reforms which should be, and could be carried out. To arrive at the completest knowledge of what lines to go on, that meeting had been arranged so that the leaders in commerce, the leaders of labour, and of the trade unions should be brought together to discuss a common subject. The two main points to be considered were first the age when children were allowed to leave school, and secondly compulsory time off. In England compulsory education stopped at fourteen. The last Trade Union Congress recommended that the age should be raised to sixteen. On the other hand the Consultative Board of Education advocated compulsory half-time from fourteen to seventeen, coupled with voluntary time off which employers are supposed to give. Those were the two main alternatives. Another suggestion was that existing education should be supplemented by continuing it up to sixteen by evening classes. But this involved a danger of overtaxing the boy's strength. Compulsory time off was, in his opinion, not possible yet, but they might try to approach it gradually. The size of London and the distance the workers are from their employment would alone militate against it. Voluntary time off was a good thing provided that the boy was in a position to profit by it. The question that they had to consider was the kind of training that should be aimed at in the schools for the whole of the boy's time and more especially for the period after eleven years of age. From the employers' point of view there could be no doubt that the conditions had changed during the last quarter of a century, largely owing to the subdivision of industries, the effect of which was that a boy was only taught one little part of his trade. It was actually an advantage to the employer that his artisans should be engaged on one small division of his trade, even though they would never become accomplished tradesmen. The conditions under which apprenticeship had flourished were killed by the new order of things. In those days seven years was not considered too long for the training of a lad. From the workman's point of view the increase of boy labour and apprenticeship meant the overstocking of any particular trade. But that was a side of the subject that could not be discussed at that conference, but rather left for the individual trade unions to deal with, and afterwards to give the result of their investigations to the public. There was one point that ought to be emphasised, viz. the large number of boys who left school and ended by drifting into the unskilled trades. There was obviously under modern economic conditions not room for them all in the skilled trades, but it was a remarkable fact that the London skilled trades were largely recruited from the country, while the London boy never got his chance. What was wanted was so to educate the boys in elementary schools that they were equipped with a general practical adaptability to readily understand the nature both of commercial and industrial work, and that they should be skilled enough to turn from one side of their work to another. While not minimising the importance of a literary education, it must be granted by all that it was of no use unless it increased the intelligence of the child in all matters which should be brought to his intelligence.

Sir Thomas Wrightson, Bart., said that as an employer of labour he had been asked to speak on the subject of providing a technical education of such a kind that the scholars should not join the ranks of unskilled labour. He would therefore deal with a system that had been adopted in a large engineering establishment in the north of England with which he was connected, and which had been successful in creating among the boys a feeling of the greatest interest in their studies, and had produced among the parents a desire to place their sons under the regulations imposed. The number of men employed in the works was over 1,500, and their output was of the widest variety. The bound apprenticeship system, which did so much for the training of artisans before the present large factory system started, had lapsed almost entirely owing to the difficulty of enforcing discipline when the masters had not the power of dismissal. There was no need to go into the question of how the bound apprenticeship system had been discouraged; it was enough to recognise that such was the condition of affairs. Their problem was to establish a form of education which would replace the old system of education apprenticeship to a handicraft, which was the lineal descendant of the old trade guilds. The difficulties which confronted them were four in number, viz.:—(1) the

C. JEAKES & Co., ENGINEERS, 51, Gt. Russell St., LONDON

COOKING, LAUNDRY, HEATING, VENTILATION, Etc.

Digitized by Google

apathy of parents; (2) the apathy of the employers; (3) the apathy of the trade unions; and (4) the apathy of the older workmen, who disliked working alongside the boys. With regard to the apathy of the parents this was due to the fact that they often preferred their boys to earn the higher wages of a labourer to the smaller wages of an apprentice. The employers were apathetic because after they had trained up the boys, these left just when they were becoming valuable, and probably joined an employer who had not taken the trouble to give any training to his boys. The trade unions were proved to be apathetic because of the fact that it was no longer an observed rule that an applicant must have the all-round training necessary for a skilled artisan. The apathy of the older workmen was really jealousy; and it was perhaps natural that they should be unwilling to give away what they considered to be the secrets of their craft to younger and more active men who might probably supersede them. In these days unless a boy obtained the mastery of more than one special operation in his trade his chance of employment was seriously diminished, for when he became a man his place was taken by another boy, and he was forced into the ranks of the casual labourer. In the engineering establishment of which he had spoken, they had tried three schemes during the past six years. For the first two years they tried to use the County Council schools, but the teaching did not answer, the interest of the boys was not aroused, and the attendance proved most unsatisfactory. It was next decided to send them to evening schools, and a drawing master was employed; but in this case the teaching was above the heads of the boys and there was a similar lack of interest. Their last scheme was to place the junior foreman in each department over the boys as teacher; as the junior foreman superintended their work during the day he was the best man to teach in the evening the theory of what they had done. This theoretical teaching could not be given during working hours; but knowing the exact work each boy was engaged in the junior foreman could readily give all the information that was necessary to make thinking artisans out of the boys. This scheme had proved most successful; the marked keenness of the attendance at the classes, and their attention was enabling the firm to turn out most promising young workmen. The standard of the technical teaching was not very high, but it was sufficient to draw out the best qualities of the boys. In some cases where a youth showed exceptional ability the firm, at their own expense, sent him to attend continuation schools where higher forms of theory were available. In their workshops there were of course machines of the greatest variety. Many of the boys who study in the evening after their long working hours were so keen that they stayed until ten and eleven o'clock. The boys were always being impressed to observe what was about them.

(To be concluded.)

AN L.C.C. MAIN DRAINAGE CONTRACT.

THE London County Council on July 6, 1909, received the undermentioned tenders for the construction of the southern low-level sewer No. 2 from Deptford to Battersea:—

Perry & Co. (Bow), Ltd., 56 Victoria Street, S.W.	£583,610 0 0
Price & Reeves, 17 Waterloo Place, S.W.	562,945 0 3
S. Pearson & Son, Ltd., 10 Victoria Street, S.W.	539,616 12 3
W. Scott & Middleton, Ltd., 98 Victoria Street, S.W.	527,037 16 0
W. Muirhead & Co., 35 Queen Victoria Street, E.C.	525,873 13 2
The Westminster Construction Co., Ltd., 22 Queen Anne's Gate, S.W.	514,000 0 0
John Mowlem & Co., Ltd., Grosvenor Wharf, S.W.	499,768 0 0
H. M. Nowell, Stockton-on-Tees	473,575 10 3
G. Shellabear & Son, 1 Mutley Plain, Plymouth	473,416 13 6

The chief engineer's estimate comparable with these tenders was 480,000*l.*

The main drainage committee recommended that an estimate of expenditure on capital account of 487,000*l.* should be approved, and that the tender of Messrs. G. Shellabear & Son should be accepted, but as this firm withdrew their tender, and as Mr. Nowell, the second lowest tenderer would not undertake the work unless he were allowed to increase the amount to 491,969*l.* 15*s.* 3*d.*, their chairman did not propose to move any of the recommendations then submitted, with

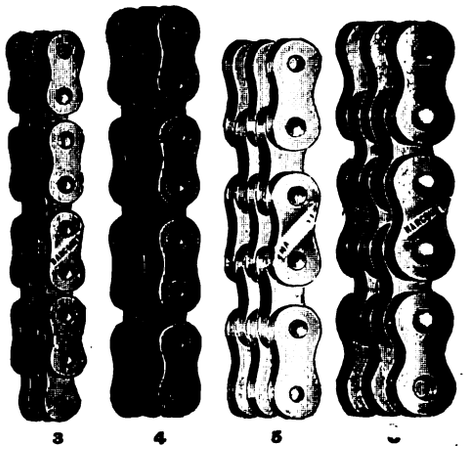
the exception of that approving the estimate of 487,000*l*. The Council, however, referred this recommendation back, and in October the committee recommended that fresh tenders should be invited for the work. The Council agreed to this recommendation, and at the same time authorised that the work be executed in sections.

After careful consideration, the committee decided that it would not be to the advantage of the Council to divide the work into sections. The principal reasons for coming to this decision were (i.) that owing to the fact that the greater part of the sewer will pass through water-bearing ground, and the construction will have to be carried out in cast iron with the aid of a shield in compressed air, special plant and appliances will be required, and it is obviously desirable that there should not be the unnecessary multiplication of this expensive plant which would result from the work being in the hands of more than one contractor; and (ii.) that if the work were divided, fresh specifications would have to be prepared, the bills of quantities would have to be split up and revised, and the contract drawings, &c., reproduced with the result that considerable expense would have to be incurred and much time would be lost. Fresh tenders were therefore invited on the same specification as on the previous occasion. These tenders have now been received and are as follows:—

Perry & Co. (Bow), Ltd., Victoria Street, S.W.	£531,384 0 0
W. Muirhead & Co., Queen Victoria Street, E.C.	525,783 13 2
Westminster Construction Co., Ltd., Queen Anne's Gate, S.W.	513,900 0 0
Whyte & Co., Ltd., Penarth	513,528 13 6
J. Mowlem & Co., Ltd., Grosvenor Wharf, S.W.	499,768 0 0
Robt. H. B. Neal, Ltd., Plymouth	488,197 7 4
E. Bentley & Son, Leicester	483,612 19 11
Griffiths & Co., Contractors, Ltd., London Wall, E.C.	481,553 9 11

The chief engineer's estimate comparable with these tenders is 489,500*l*. The first four tenders have been checked and arithmetical errors, if any, have been corrected.

The main drainage committee think that the lowest tender should be accepted. Their recommendation will be considered at the meeting next week.



A clause has been inserted in the form of contract to provide that the contractor shall give preference in employment on casual or unskilled labour required for the work to men *bona fide* resident in the county of London.

The sewer, which will relieve the existing low-level sewer and diminish the possibility of floodings occurring in the low-lying districts through which it will pass, forms part of the scheme of main drainage extension approved generally on December 5, 1899, and when the work is put in hand the whole of the new sewers provided for in the scheme will either have been completed or be in course of construction. The contract time for the work is three years, and the expenditure will be divided approximately as follows:—Financial year 1909-10, 10,000*l*.; 1910-11, 150,000*l*.; 1911-12, 150,000*l*.; and the remainder in 1912-13.

The complete provision made by the great railway companies nowadays for the rapid conveyance of Christmas parcels and hampers is in striking contrast to the old-time methods, and the Great Central Railway Company are again to the front in catering for the needs of the public at Christmas time. They announce that frequent collections of parcels will be made at the Receiving Offices in London and the large centres, and the traffic will be despatched by the first available train after receipt. Special trains will be run, and additional through vans attached to the principal express and mail trains to accommodate the traffic. Reduced through rates are now in operation, and the minimum weights formerly charged on packages of perishables at owner's risk have been abolished, the charges now being based on the actual weight. The rates for parcels carried short distances are lower than those by parcel post, and in the case of longer distances the rates for parcels beyond 1 lb. by parcel post are not exceeded. It is suggested that a duplicate label be enclosed in each package giving the name and address of the consignee in the event of the outside address becoming detached or defaced. A van will be sent to collect anything you may wish to despatch on ringing up "Parcels Superintendent, Marylebone Station, No. 584 Paddington."

WOOD IRON AND STEEL REVOLVING SHUTTERS FOR SHOPS, GOODS, TRAM-ENGINE & CARRIAGE SHEDS
HODKINSON & Co LTD SMALL HEATH BIRMINGHAM

Thirty-sixth Year of Publication. Now Ready.

"THE ARCHITECT'S DIARY" for 1910.

Specially prepared for the use of **ARCHITECTS, SURVEYORS,** and **ENGINEERS.**

These Publications contain not only the usual Diary, ruled and printed to a particular form, specially adapted for professional use, but, in addition, an Index, a Note-Book, a Rent and Insurance Register, a Cash Book, and a Ledger, with all the usual diary information, and much special matter referring to the various Architects' and Engineers' Associations; a digest of all the Acts passed last Session; contain also cases decided in the Superior Courts of Justice during the legal year, from November 1908 to August 1909, of interest to the Profession; Regulations of the London County Council under the orders of the Council applying to Music, Dancing, Theatre, and other Licenses; complete List of Metropolitan Surveyors and Districts, with Official and Private Address; Alphabetical Index to the Practical Statutes, Stamp Duties, &c., the whole forming in ONE VOLUME A COMPLETE SET OF BOOKS FOR THE YEAR. The Editions are—

No. 12.—One page to a day, size 8¼ in. by 5 in., cloth, gilt, 4/6. | No. 13.—Two pages a day, size 8¼ in. by 5 in., cloth, gilt, 5/6

"THE BUILDER'S DIARY" for 1910.

Specially prepared for the use of **BUILDERS** and **CONTRACTORS.**

No. 11.—Two days on a page, ruled and printed to a special pattern; also contains Bill Register, Note Book, Rent, Insurance, and Mortgage Register, Cash Book, Ledger and 130 pages of Tables of great value to all engaged in the Building Trade, in all 460 pages, size 8¼ by 5, bound, whole cloth, gilt. Indexed, and paged to end of Diary. **Price 4s. 6d.**

"For use in the office of Architects and Builders they are better fitted than any diaries with which we are acquainted."—*The Architect.*
"The novel and valuable feature of these Diaries is that each volume forms in itself a complete set of books for the year."—*The Builder.*
"We have used them ourselves throughout the year with much satisfaction, and are glad now to draw attention to the new batch sent us."—*The Building News.*
"Messrs. Hudson & Kearns's Diaries need no recommendation save a trial."—*The British Architect.*
"The Diaries published by Messrs. Hudson & Kearns are quite unrivalled for convenience and comprehensiveness."—*Building World.*
"These Diaries may be said to have become the Diaries for the professions for which they are issued."—*Illustrated Carpenter and Builder.*

Sole Publishers, HUDSON & KEARNS, Ltd., Hatfield Street Works, Stamford Street, S.E.

To Architectural Students.

Back Volumes of **THE ARCHITECT** will be found to be of great value to you, containing as they do fine examples of measured drawings, perspective work, and details; all of importance to you in your studies. **Call at the Offices, 6-11 Imperial Buildings, Ludgate Circus, E.C.,** between the hours of 10 A.M. and 5 P.M. on any day but Saturday, and ask for some back volumes to look through. Cost of each volume, containing over 100 examples, is **12s. 6d.**

Telephone No. 4725 Holborn.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

Warrington.—Dec. 30.—For erection and completion of two new swimming baths, new slipper baths, and sundry alterations to the Corporation baths. Deposit 2*l.* 2*s.* Mr. Thos. Longdin, borough engineer and surveyor.

Wednesbury.—Dec. 21.—For the enlargement of the post office. The Postmaster, Wednesbury.

Winchester.—For erection of suggested swimming and other baths in Winchester. Mr. J. Ashton Sawyer, chartered surveyor, 59 High Street, Winchester.

Messrs. Horne & Co. state that in consequence of the demolition of the West End offices at No. 8 Delahay Street, under the Public Offices Sites (Extension) Act, 1908, they have removed to 35 Old Queen Street, Westminster, S.W.

Mr. H. R. Hooper, M.I.C.E., a Local Government Board Inspector, held an inquiry at the Guildhall, York, on the 3rd inst., into the application of the City Council for sanction to borrow 25,250*l.* for the construction of a new street from Pavement to Piccadilly, York. The scheme has been under discussion for a considerable time.

"Who's Who," with its supplementary publication of "Who's Who Year-book," is just about to be issued for the year 1910. This valuable work, which should be found in every well-regulated office, is becoming larger and bulkier every year, and the result has been that the compilers have been compelled to issue the Year-book as a separate publication. The editor, in a note, states that "in spite of the large number of reference books there is still need for one where the information can be seen literally at a glance and which includes not only the gist of information contained in many expensive publications, but some original tables to be found nowhere else." This claim of the editor's is fully maintained in the issue to hand, and with the two publications the business man has in his possession a work as desirable as the Post Office Directory. From the same publishers, Messrs. A. & C. Black, we have received two other important issues—the Englishwoman's Year-book and the Artist's and Writer's Year-book. The total outlay is 15*s.*—a very small cost for four volumes of valuable information.

VARIETIES.

The North Dublin Rural District Council propose to erect ninety-seven labourers' cottages at a cost of 19,278*l.*

"Old English Porcelain" is the subject of a handsomely got-up and well-illustrated book, published by Messrs. Stoner & Evans, of 3 King Street, St. James's Square, W., as a souvenir of the fine exhibition of characteristic specimens of English industrial art recently held at their Galleries, which attracted so much well-deserved attention.

"The Energy of Radium" forms the subject of a very remarkable article in the Christmas number of "Harper's Magazine," which also contains among much other reading matter, an interesting account of "A Hilltop in Paris," illustrated by some clever etchings, and an article on "The Art of Harold Speed," by C. H. Caffin.

A company has been registered called the Bristol Grand Theatre of Varieties, Ltd., with a capital of 25,000*l.*, to erect a first-class music-hall at East Street, Bedminster. Plans prepared by Mr. W. S. Skinner, architect, Bristol, have been passed by the local authorities.

Cleethorpes Council held a special meeting on the 1st inst. to consider the position with regard to the proposed sewerage scheme. Having prepared a drainage scheme, to cost 35,000*l.*, the Council sought the sanction of the Local Government Board to proceed with the work, but the Department insisted on a bigger scheme, estimated to cost 90,000*l.*, and withheld their consent for the lesser proposal. Last week the Council unanimously resolved to apply to Parliament for powers to proceed with their original scheme.

The Corporation of Bath are inviting a competition value 50*l.* for the best scheme for laying out the well-known gardens adjoining the famous North Parade in that city. These gardens are historical and adjoin the Literary Institute, which stands upon the site of the Old Assembly Rooms, which for nearly half a century was ruled by Beau Nash, the King of Bath. In the gardens the Corporation have recently erected a drinking fountain where visitors can take the hot mineral waters in the open, and it is their intention to so develop this garden to make it one of the most attractive spots in the centre of the city. This is an opportunity afforded to architects who are skilled in the laying out of grounds with some knowledge of landscape gardening.

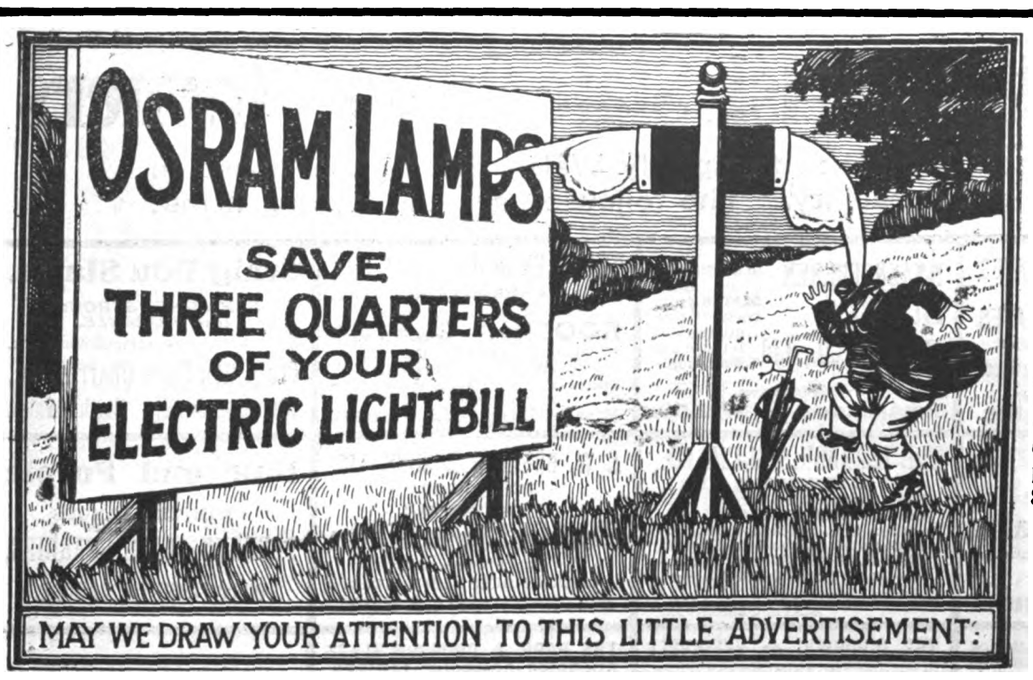
NO. 27, DR. ALEXANDER ROSS, LL.D., F.R.I.B.A.

QUENBY HALL, LEICESTERSHIRE.—DETAILS OF PRINCIPAL BAYS.

COMPETITION DESIGN FOR BERKSHIRE COUNTY COUNCIL OFFICES, READING.



ON Monday last a Local Government Board inquiry was held at Croydon regarding the application made by the Council to borrow 10,770*l.* for the extension of the borough isolation hospital.

THE parish church of Holy Trinity, St. Andrews, N.B., was re-dedicated recently, after restoration at a cost of about 22,000*l.* The building dates from the first half of the fifteenth century, and the present work shows the edifice as it was before the destructive alteration of 1798. The church consists of a nave 161 feet long, divided from the aisles by arcades of nine arches. Beyond these project the north and south transepts, giving a total breadth of 127 feet. The south porch, a magnificent vaulted structure, has been rebuilt in memory of John Knox, who "in this town and Churche began God first to call me to the dignitie of a preacheour." The vaulted session house occupies the site of a former chapel, west of the south transept, and the vestries occupy a similar position in relation to the north transept. The church now seats 1,885 persons entirely on the ground floor. The pews are all of oak with carved bench ends. The walls both inside and outside are of finely tooled ashlar stonework, and are 3 feet, and in some cases 4 feet 6 inches thick. The windows have finely moulded jambs and traceried heads, with carvings at each end of the hood-moulds. Besides the south porch the church has also a magnificent double-arched doorway at the west front, over which are five fine long windows with inside pillars springing from behind a traceried gallery over the doorway. The clerestory is semi-circular and cusped, with an internal arch and angle shafts, with bases resting on the string course over the arcade. The church is rich in sculpture work. A chapel or aisle has been erected beside the south aisle. All the roofs are of carved oak, the framework of the north and south aisles being of timber grown in Fife. The roof of the long nave is barrel-vaulted and enriched with moulded ribs, carved bosses, and at each bay large sculptured panels painted and gilded. These form three rows, the centre illustrating the Life of our Lord, while the side panels depict incidents from the Old Testament. There is a complete installation of electric lighting. The building is heated by a hot-water system of coils and radiators, which are placed throughout the whole ground area and along the clerestory windows on each side. The work has been carried out by Mr. P. MacGregor Chalmers, architect, Glasgow.

NEW CATALOGUES.

EDWIN J. PEARCE & Co., LTD., Leicester, show by their catalogue that they are in a position to take a very large share in the erection of a building. They have their own system of fireproof floors (for which a patent has been applied), staircases, landings, &c. At Kirby Muxloe, near Leicester, are their granite concrete stone works, and they also turn out an improved grano-paving for stables, breweries and similar uses, 2-inch and 2½-inch paving slabs for footways, and concrete kerbs, &c. They possess a large stock of well-seasoned deal, pitch-pine, maple and oak for wood-block and parquet floors; and lastly they have carried out a number of contracts in Roman and Venetian mosaic for public and private buildings. This mosaic work is illustrated by several coloured reproductions, which show that the firm use most excellent designs and that the colour effects are harmonious, though not lacking in power.

As "fire-proof" construction can only be a relative term it is important that all other means of fire-resistance should be of the highest possible order. Therefore, although Messrs. F. Reddaway & Co., Ltd., 212 Shaftesbury Avenue, W.C., are not constructional engineers, yet they fill a prominent place in the ranks of those who are striving to combat the danger of ruin by fire. Their repute as makers of canvas and rubber lined hose-pipes may be said to have been unassailably established when in the present year they executed an order for the Admiralty for 485,000 feet of fire

OSRAM LAMPS

The other important features of the OSRAM LAMP are:

Length of Life: Averaging over 2,000 hours.

Pure White Light. Colours can be matched as in daylight.

Burns in any position on any lighting circuit, and fits existing lampholders.

Range: ONE to 1,000 Candle-power.

Prompt delivery from Stock.

hose, this being the largest order ever placed. Messrs. Reddaway announce that instead of supplying their goods through merchants and dealers, as heretofore, they are now prepared to sell direct to users. They can boast that they are the only firm in the United Kingdom which prepares its own yarn, weaves its own canvas-hose and lines the same with rubber. Their "Sphincter Grip" is a patent method of armouring hose-pipe with spring steel-wire. Hose-pipes are only one of their appliances; in the catalogue are a great number of other aids for fighting the flames, including fittings, ladders, pumps, hydrants, buckets, and much else. Messrs. Reddaway are prepared to inspect buildings and report upon the best means of protection from fire.

The growth in the erection of hollow concrete block structures is one of the most noticeable developments in latter-day methods of building. This type has now left the experimental stage, when its users had to accept certain unknown as well as known risks. During the past five years and more a succession of structures have been built of these blocks. The variety of concrete machines has also been widening, and their efficiency has also been increasing. The Winget concrete building block machines were, we believe, one of the pioneers. Catalogue A, issued by the (U.K.) Winget Concrete Machine Co., Ltd., is a complete account of the subject of concrete blocks, and of their machines in particular, with illustrations of the processes of making, as well as of a very large number of bungalows, cottages (singly, in blocks, and in rows), villas, houses, and the accessories of the machine. The blocks are both hollow and solid, and are not subjected to any mechanical pressure. The "Winget" machine makes all classes of blocks required, from start to finish, except those parts having a length of over 32 inches. Under the most unfavourable conditions the output is guaranteed as over 200 blocks 32 inches by 9 inches by 9 inches a day. The catalogue is clearly and concisely written.

We have received from Messrs. Wilsons, Pease & Co., Ltd., ironmasters, of Middlesbrough-on-Tees, a copy of a booklet they are issuing. The works were established in 1853, and are consequently one of the oldest in that important district. They possess three blast furnaces, 82 feet high, with a capacity of 2,400 tons per week. An important part of their business is in direct castings and "open sand pig bed castings"; the iron is run direct from the blast furnaces. By this means these castings can be supplied cheaper than by the process known as "second melting." The firm produce railway chairs, columns, girders, brake blocks, bowl sleepers, &c. Several important specialities are made by the firm; one is their patent steel-back brake block, which consists of a plate of mild steel, upon which the body metal is cast. By this means the life of the block is practically doubled. Another, and possibly more important, patent is the tramway anchor chair, and Messrs. Wilsons, Pease & Co., Ltd., claim that this is in advance of any other chair upon the market, and is at the same time the cheapest. Their London agent is Mr. A. H. Sharpe, of 8 Eastcheap, E.C.

Messrs. Smith & Wellstood, of Bonnybridge, N.B., and Ludgate Circus, London, E.C., have just issued their new catalogue, which they entitle "A Practical Handbook for Architects and Householders." Illustrations are given of their patent ranges, and full descriptions, measurement, and charges. The catalogue is produced on good paper and in a handy size, and consists of sixty-four pages with cover. In the opening remarks Messrs. Smith & Wellstood state that this booklet has been compiled with a view to explain important points in cooking ranges, and to show how the many improvements introduced into "Wellstood" cooking ranges economise fuel and labour.

Messrs. Twyford, Ltd., the well-known sanitary potters of Hanley, have just issued three new lists. No. 1 shows their pedestal valve w.c.'s, for which the advantages claimed are practically silent in action, area of water surface larger than seat opening, and double seal against sewer gas. The basin, slop, top and enclosure are all made in fine white C.V. earthenware, which the firm guarantee as non-crasing; the materials used and the workmanship are guaranteed of the best. Pamphlet No. 2 shows the new design "Eurite" lavatories. The basin is of the latest pattern, with plain surfaces and rounded edges, and is of the same high quality of manufacture as the w.c.; the legs and supports are nickel-plated on iron, and are neat and simple in design. Pamphlet No. 3 is of Messrs. Twyford's new design "Convenient" w.c. "The Convenient" w.c. combination is compact in construction, silent in action, and neat in design; the basin

The Leading Welsh Slate Quarry Owners

Architects are asked to specify Welsh Slates, the finest in colour and durability. The following are the leading firms:

The PRECELLY GREEN SLATES — and — **The PRECELLY RUSTIC SLATES**
Made in Randoms and Peggies.
A Welsh Slate of unique appearance.
For particulars apply to
DAVIES BROS., Portmadoc, N. Wales.

is the now well-known Centaur syphon, which has a large water area, and particularly deep seat. The cistern is constructed on the float-valve principle, and operates with the greatest ease, whether supplied on the press-button or lever action. All are guaranteed of first-class workmanship, and to uphold the firm's reputation for durability and for the purity of colour. It is pleasant to review these three little pamphlets; the printing is clear, the illustrations are excellent, and the art paper assures a good impression. An architect can make use of these where many a catalogue has to be sacrificed to make room.

MESSRS. BARFORD & PERKINS, engineers, Peterborough, have adopted an ingenious method for showing the wide geographical area covered by them in their business. Inside their catalogue they insert a map of England with an index showing the towns and buildings in which their steam cooking and other apparatus are fixed. As these numbered nearly two hundred over seven years ago, and as they are evenly distributed, it would be an easy matter for anyone to see the apparatus in operation. Messrs. Barford & Perkins have been engaged in this kind of work for sixty years; indeed, they were one of the first to introduce the use of steam into workhouses and other institutions for cooking, laundry-work, heating, and hot-water supply. Special attention should be called to their slow-combustion steam boilers, which are designed to facilitate cleaning out and to effect economy and durability. Steam-cooking apparatus is only one of the many appliances manufactured by Messrs. Barford & Perkins for use in large and small workhouses, asylums, schools, and similar institutions.

APPRENTICESHIP AND TECHNICAL EDUCATION.

(Concluded from last week.)

MR. WALTER HAZELL, speaking on behalf of the printing trades, said there could be no gainsaying the statement that employers should not be satisfied with themselves when they considered their position with regard to this question, for they had not been living up to their responsibilities. They had opportunities for doing good to their boys, but they did not take advantage of them. It was very uncertain under the existing system what teaching the lads might get. A boy might be under a foreman of great skill and good conscience who would turn him into a skilled workman; separated from him only by a partition there might be another such boy; who under another kind of foreman might not learn anything at all. In his own firm they had tried to remedy this by sending each apprentice at regular intervals before one of the heads to report himself. In addition they did all that lay within their power, as by paying a portion of the fees to promote development outside the workshops. It was found that the lads began by attending regularly the evening classes, but that they gradually began to fall off. The reason was that the working hours during the day were too long. In addition in some instances the boys had to spend over a couple of hours in getting to and from their employment. After a hard day's work how much strength has the average boy got for further study? Of course there were physical and mental exceptions to this, but they had to provide for the average. The boys who worked overtime in their evening schools ought really to be in bed. What was wanted was technical education in trade schools during working hours. To a certain extent something had already been done on these lines, but not enough. The nation was far too insular, and would find that unless they roused themselves to a greater interest in these matters they would go to the wall.

Mr. W. A. Nicholls, of the National Union of Teachers, said that it was very desirable to foster public interest in the question as to the best training to be provided in our national schools. In 1870 and 1876 when the children were being forced in large numbers into elementary schools, the great mistake was made of making the education too mechanical and formal, and with very little reference to the life of the scholars. It was to be hoped that the opposite mistake was not being made now. The education in the elementary schools of London should not be arranged purely with a view to the children being engaged in industrial occupations afterwards. Some of the scholars should receive the foundations that were necessary for them to fill what were called the higher positions of life, so that the young scholar should have the chance of going to the very best secondary schools and finally to the universities. But still the studies of both boys and girls should be made better adapted to the work they will have to do. They wanted to be prepared to

take up some trade or industry, but not to be irrevocably tied down to that trade or industry. If of real ability he or she will make use of the extraordinary facilities now offered for the development of intellect. The education in our elementary schools should however, be made less formal and more practical. It was quite possible to shorten the number of hours at present devoted to literary subjects, so that in the afternoon time might be given to the training of hand and eye, and making these two organs entirely subservient to an intelligent brain. The classes could be gradually rendered more interesting, and the children they turned out more useful to the community at large. But there was one thing that was necessary and that was to raise the age to fifteen. If it was objected that the working man could not afford to do without the help of the child until that age he would say that it would pay the State to make it possible. It would bring both economic and intellectual advantages. It was impossible to expect that the ordinary girl or boy would come to evening classes after working all day with any very great keenness for the acquisition of knowledge or to work hard. But if their hours of labour were limited to thirty a week then they would be in a position to gain that learning which would save them from sinking into the unskilled trades as at present, and joining the ranks of the unemployed and unemployable.

Mr. E. Penton, speaking as a representative of the boot and shoe trade, said that so far as his experience went, the question was best left to the educational authority. There certainly was a difficult gap between the period when the boy left his elementary school and the time when he was ready to take full advantage of technical education; that was to say during the two or three years after leaving school. There was no good in his taking up technical work at once, for there was enough that he could pick up about his business in the workshop. The objection to this was that in the interval the boy might lose the art of learning. It was a great tax to expect a boy to be able to work hard after his working hours. In these days of specialisation they wanted trade schools that would teach a boy his job and only his job, for their workmen had to be the best possible. In a trade school it was possible to teach him sufficient theory to make him a very skilled operator with only a short experience in a factory. It would be a great mistake if in training schools they did not systematise but made a boy a Jack-of-all-trades. Apprenticeship in the boot trade was a thing of the past.

Sir George Gibb introduced the second point down for consideration:—"The organisation of facilities for bringing boys and girls who are leaving the public elementary schools into better touch with the openings that exist in the industrial and commercial world." He said that we educate our children and employ them afterwards; but the critical passage in between, on which so much rested, was left to chance. Upon that period depended largely whether the value of training was to be realised or wasted. The greatest national asset was the skill and industry of the people, without it capital would be fruitless and barren. Yet there was a considerable waste of that asset. The value of training was frequently lost, unsuitable employment was encouraged and unemployment resulted, from the existing defective organisation. Advice at the moment of a choice of employment was of immense value yet it was impossible sometimes to obtain. The existing policy which brings about so much national waste was therefore to be avoided. It was impossible for isolated individuals to bring supply and demand into proper harmonious relations. There must be special organisation to bring training into closer relations with what was the object of training—not personal culture, but with getting work to earn a living. Such a body would deal not with a selected best, but with all sorts. Such an organisation would have to be genuinely used by employers and by those who desired to obtain help on leaving school. A vast amount of rough sorting was possible.

Sir William Bousfield said that in London over twenty local committees had been formed for the purpose of aiding parents and children to obtain satisfactory work. The first object of the committee was to put the children to employment that was likely to lead to something, so that they should not be leaving their work after three years and turning to another trade. Parents seemed so ignorant on the subject of the best way of choosing the kind of employment for their children. In London the number of trades was so great that there was a difficulty in deciding which would prove of the greatest advantage to the different children. In the provinces where there was one staple industry followed by father and

PROUT'S
CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says:—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest."

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my ectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist, however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately, there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

PUBLISHERS, GILBERT WOOD & CO. LTD.,

son this did not apply in the same way. The headmasters of elementary schools were generally not in a position to properly advise, no matter how willing they might be. Another part of the work of the committees was to enter into relations with employers. A right choice at the beginning was all important. It was almost impossible for a boy to change his trade except at the very beginning. A plumber's mate, for example is, except in unusual conditions, unable to get beyond the position of plumber's mate. It might be possible to revive apprenticeship in some few cases, and it might be useful. But it was absolutely necessary that there should be a substantial reduction in the premiums demanded; 30*l.* was far too much. The experience of the committees was that in those cases where they had paid the apprenticeship premiums the boys were very pleased to repay all or part of the amount when they were able.

Mr. A. Gossep (general secretary of the National Amalgamated Furnishing Trades Association) said that he heartily agreed as to the absolute necessity of boys entering skilled trades receiving a better training; if it was not forthcoming very soon there would be no scientific workmen left in the country. Unfortunately at the present time there was nothing like enough room for all. He could not agree with what a previous speaker had said as to the causes of the present lack of education among the boys. The so-called apathy of the parents was really due to their being forced by poverty to send out their children to work directly they could help the family. The real cure was to be found by raising the standard of taste among all classes, and more particularly among the rich, so that they should not be content to purchase shoddy goods and thereby help to stifle the pride in his work which should be felt by every one, and which at the present time the young men were not encouraged to develop. The surest means to reduce the prevalent unemployment was to reduce the hours of labour. Thirty hours a week were ample for a young man who was doing extra study at technical classes. These classes should be conducted at the expense of the employers. For as they benefited by the skill of the workmen produced it was not altogether fair that the State should bear the entire burden.

Mr. E. Friend (representing the vellum binders), Mr. Ben Tillett, Mr. Sedgewick, and others addressed the meeting, which was brought to a close by Mr. Barlow, of the London County Council, commenting on its highly satisfactory nature.

TRADE MARKS OF CONSTRUCTIVE MANUFACTURERS.

AN L.C.C. BUILDING ESTATE.

In May last the London County Council decided to proceed in due course with the development of the Old Oak Estate, Hammersmith, W., by the erection thereon of artisans' dwellings. The Housing of the Working Classes Committee now recommend that the work should be commenced as soon as possible. Their report on the subject is as follows:—

There can be little doubt that the district surrounding this estate will grow very rapidly in the near future, and we consider it desirable that arrangements should now be made for building operations to be commenced as soon as possible. The estate, which was purchased from the Ecclesiastical Commissioners in 1905 for 29,858*l.*, has been divided into two parts owing to the acquisition by the Great Western Railway Company of a strip of land for the purpose of constructing a branch line from Acton to Shepherd's Bush. The Council has received from the company in respect of the sale of this land and the damage sustained by the estate a sum of 10,500*l.*, which, after deducting 450*l.* for plans rendered useless by the severance of the estate, has been carried to the Consolidated Loans Fund in redemption of debt, the effect being to reduce the charge for land to be made against the dwellings account. The estate now comprises some forty-six acres, and we propose that in the first instance the Council should proceed with the development of the section situated to the west of the proposed railway. This section, which is about fourteen acres in extent, or rather less than one-third of the whole estate, is triangular in shape, and will be connected with the eastern section at the north-west and south-east boundaries and about midway between those points by roads under the railway. Particulars of the scheme of development which we have provisionally approved

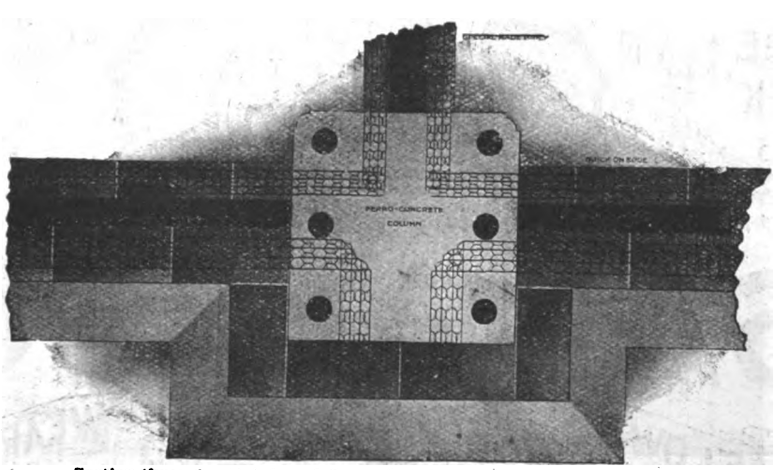
for the western section, and of the rents proposed to be charged, are as follows:—

Number and Description of Tenements	Particulars of Accommodation	Rents
5 shops	Five rooms over shop...	30*l.* a year.
42 cottages	Five rooms, scullery and bath	10*s.* a week.
27 ,,	Four rooms, boxroom, scullery and bath	10*s.* a week.
92 ,,	Four rooms, scullery and bath	5 at 10*s.* a week and 87 at 9*s.* 6*d.* a week.
14 ,,	Three rooms, boxroom, scullery and bath	8*s.* 6*d.* a week.
9 ,,	Three rooms, boxroom and scullery ...	8*s.* a week,
101 ,,	Three rooms and scullery	97 at 7*s.* a week and 4 at 5*s.* 6*d.* a week.
6 ,,	Two rooms, boxroom and scullery ...	4 at 5*s.* 6*d.* a week and 2 at 5*s.* a week.
16 ,,	Two rooms and scullery	4*s.* a week.
12 flats	Two rooms and scullery	3*s.* 9*d.*, a week.
14 ,,	One room with bed recess and scullery ...	3*s.* 6*d.* a week.
328		

The rents mentioned have not been definitely fixed, but they are subject to slight adjustment at a later stage. The rents of the cottages and flats are inclusive of rates.

In framing the present scheme we have been guided by the policy of endeavouring to meet the demand for the smaller cottages which can be let at rents within the reach of those earning from 25*s.* to 30*s.* a week. We think that only a small number of the larger type of cottage, for which a rent of 10*s.* a week will be charged, should be erected, and that rather more than a third of the total number should be three-roomed cottages, to be let at rents ranging from 7*s.* to 8*s.* 6*d.* per week. We have also considered the needs of the smaller families of the poorer class requiring only one or two rooms, and we propose that, as an experiment, the Council should provide a limited number of tenements of one, two, and three rooms, at very low rents. The smallest type of one-room cottage flat, with a recess for a bed and a separate scullery and water-closet, can probably be let at a rent of 3*s.* 6*d.* a week. As we have pointed out on previous occasions, we feel that those who require larger tenements than those now proposed, and who can afford to pay a higher rent than 10*s.* a week, are being provided for by other agencies.

In connection with the development of the Old Oak estate we have considered the question of utilising the Acquisition of Lands (Part III.) Fund, the balance of which, after defraying certain expenditure on the Millbank site account, amounted on September 30, 1909, to 49,345*l.* This fund was created under statutory authority by the transfer of a sum of 50,000*l.* from the account of the Westminster improvement to the capital account of the Dwelling-house Improvement Fund to be applied towards the cost of acquiring other land for the purpose of Part III. of the Housing of the Working Classes Act, 1890. Authority was, however, conferred by the London County Council (General Powers) Act, 1908, for the application of the fund towards the development of estates already acquired under Part III. of the Act; and on February 11, 1908, the Council decided that any portion of the fund applied in pursuance of such authority should be made subject to a charge for interest equal to the cost of the capital moneys in question when raised for the Westminster improvement, and to a sinking fund charge on the usual basis, and that the surplus accruing annually should be credited to the Housing (Part III.) account in diminution of any charge upon the rates arising thereunder. The effect of this will be that by utilising the balance of the fund the capital account of the dwellings will benefit to the extent of 896*l.* It will be convenient, both as regards estimates and accounts, if the use of the fund be confined to one estate, and we suggest, therefore, that the balance of the fund should be applied towards the cost of the cottages now proposed to be erected on the western section of the Old Oak estate.



As regards the financial aspect of the present scheme, it is estimated that the income to be derived from rents will be sufficient to provide for all expenses of maintenance and management and to leave a balance available for payment of debt charges on a capital sum of 95,597*l.*, calculating interest at 3*l.* 12*s.* 6*d.* per cent. By utilising the balance of the Acquisition of Lands (Part III.) Fund at 3*l.* 11*s.* per cent. this sum will be increased to 96,493*l.*, which represents the maximum capital expenditure which may be incurred if the undertaking is to be self-supporting. The total cost of developing the section, including erection of cottages, formation of roads, general development charges and all incidentals, will probably not exceed 88,511*l.* To this should be added the sum of 5,628*l.*, being the proportion of the net cost of the land applicable to this section, making a total capital outlay of 94,139*l.* The estimated capital surplus is therefore 2,354*l.*

Among the conditions upon which the Council purchased the estate were the following:—

(1) A plot of land 1½ acres in extent in the centre of the estate to be re-conveyed to the Ecclesiastical Commissioners to be used as a site for a church, the area of this plot to include half the area of the surrounding roads and to be deducted from the acreage sold and not charged for.

(2) Ducane Road to be widened to 50 feet in front of Wormwood Scrubs prison and continued along the southern boundary of the estate to Old Oak Common Lane, the Council paying a moiety of the cost of constructing the road and providing half the land required for the extension.

(3) The contract price for the houses fronting on Ducane Road to be not less than 250*l.* each.

(4) The scheme for the laying out of the estate to be subject to the approval of the Commissioners.

The particulars which should now be submitted to the Commissioners for their approval include a plan showing the laying out of the western section of the estate and the church site, which we suggest should be in a central position on the eastern section.

We propose in the first place to proceed with the widening and extension of Ducane Road in conjunction with the work of constructing roads and sewers on the western section. The cost of this work, together with the cost of works of a general character required in connection with the development of the western section, is estimated at 20,550*l.*, of which about 3,200*l.* is chargeable to the eastern section of the estate. A moiety of the cost of widening and extending Ducane Road is recoverable from the Ecclesiastical Commissioners and the Great Western Railway Company in proportions to be determined hereafter. The cost of the cottages and shops proposed to be erected on the western section, including articles to be bought direct, printing and professional charges, is estimated at 74,511*l.* It is proposed to proceed with the erection of the cottages as soon as the construction of roads is sufficiently advanced to permit of building operations being commenced. The development of the whole estate will occupy about ten years, and will cost approximately 340,000*l.*; while the expenditure of 95,061*l.* which we now ask the Council to sanction will, it is estimated, be divided as follows: Financial year 1909-10, 4,000*l.*; 1910-11, 30,000*l.*; 1911-12, 30,000*l.*; and the remainder in 1912-13.

We are in communication with the Education Committee as to the provision of school accommodation on the estate, and we will report further on the subject at a later date. The approval of the Local Government Board will be required to the utilisation of any of the land for school purposes, and the Board's approval is also required to the provision of the five shops included in the present scheme. We recommend:—

(*a*) That the estimate of expenditure on capital account of 20,550*l.*, submitted to the Finance Committee in respect of the construction of roads and sewers and works of general development on the western section of the Old Oak estate, and the widening and extension of Ducane Road along the southern boundary of the estate, and of all incidental expenses in connection therewith, be approved as an estimate of costs, debt, or liability under section 80 (3) of the Local Government Act, 1888.

(*b*) That the estimate of expenditure on capital account of 74,511*l.*, submitted by the Finance Committee in respect of the erection of cottages and shops on the western section of the Old Oak estate, and of all incidental expenses in connection therewith, be approved as an estimate of costs, debt, or liability under section 80 (3) of the Local Government Act, 1888.

(*c*) That the amount standing to the credit of the Acquisition of Lands (Part III.) Fund be applied towards the cost of the development of the western section of the Old Oak estate, subject to the conditions specified in the resolution of February 11, 1908.

(*d*) That the scheme submitted by the Housing of the Working Classes Committee for the laying out of the western section of the Old Oak estate and the approximate position of the church site on the eastern section of the estate, as indicated by blue colour on the plan, be approved; and that the Ecclesiastical Commissioners be asked to approve the scheme for the laying out of the western section and the approximate position of the church site, in accordance with the terms of the agreement entered into between the Commissioners and the Council on February 22, 1905.

(*e*) That, in pursuance of section 11 of the Housing of the Working Classes Act, 1903, application be made to the Local Government Board for its consent to the provision of five shops on the western section of the Old Oak estate, as shown by yellow colour on the plan.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

TRADE NOTES.

Messrs. Sprague & Co.'s pocket-book, which is so well known to architects and surveyors, is for the new year, 1910, more valuable than ever, as there have been added lists of the principal officers, the members of Council and the committees, together with the dates and particulars of meetings of the Royal Institute of British Architects, the Architectural Association, the Surveyors' Institution, the Society of Architects, and the Quantity Surveyors' Association. It is rather hard on Messrs. Sprague that they should find their publication of the list of His Majesty's Ministers followed immediately by a General Election, which may possibly render the information incorrect.

Messrs. Smith, Major & Stevens, Ltd., have just been instructed by the Lords Commissioners of the Admiralty to supply and erect on board the new Dreadnought battleship H.M.S. *Neptune* four of their electric passenger lifts, the order having been obtained after an exhaustive enquiry into the merits of the lifts in question.

The balance sheet of the Saxon Portland Cement Company, just published, shows the company has had a most successful year. After paying Debenture interest and 6 per cent. upon the Preference shares, there remains for distribution 5,628*l*., a sum equal to 22½ per cent. upon the ordinary share capital of the company.

VARIETIES.

A new out-patients' department is to be erected at the Dundee Royal Infirmary at a cost of 3,800*l*.

The North British Academy of Arts are to hold their second exhibition at the Corporation Art Gallery, York, in January. The first annual exhibition was held at Newcastle.

The Plymouth Town Council have referred back for further consideration a decision of their special works committee to prohibit the use of hollow concrete blocks.

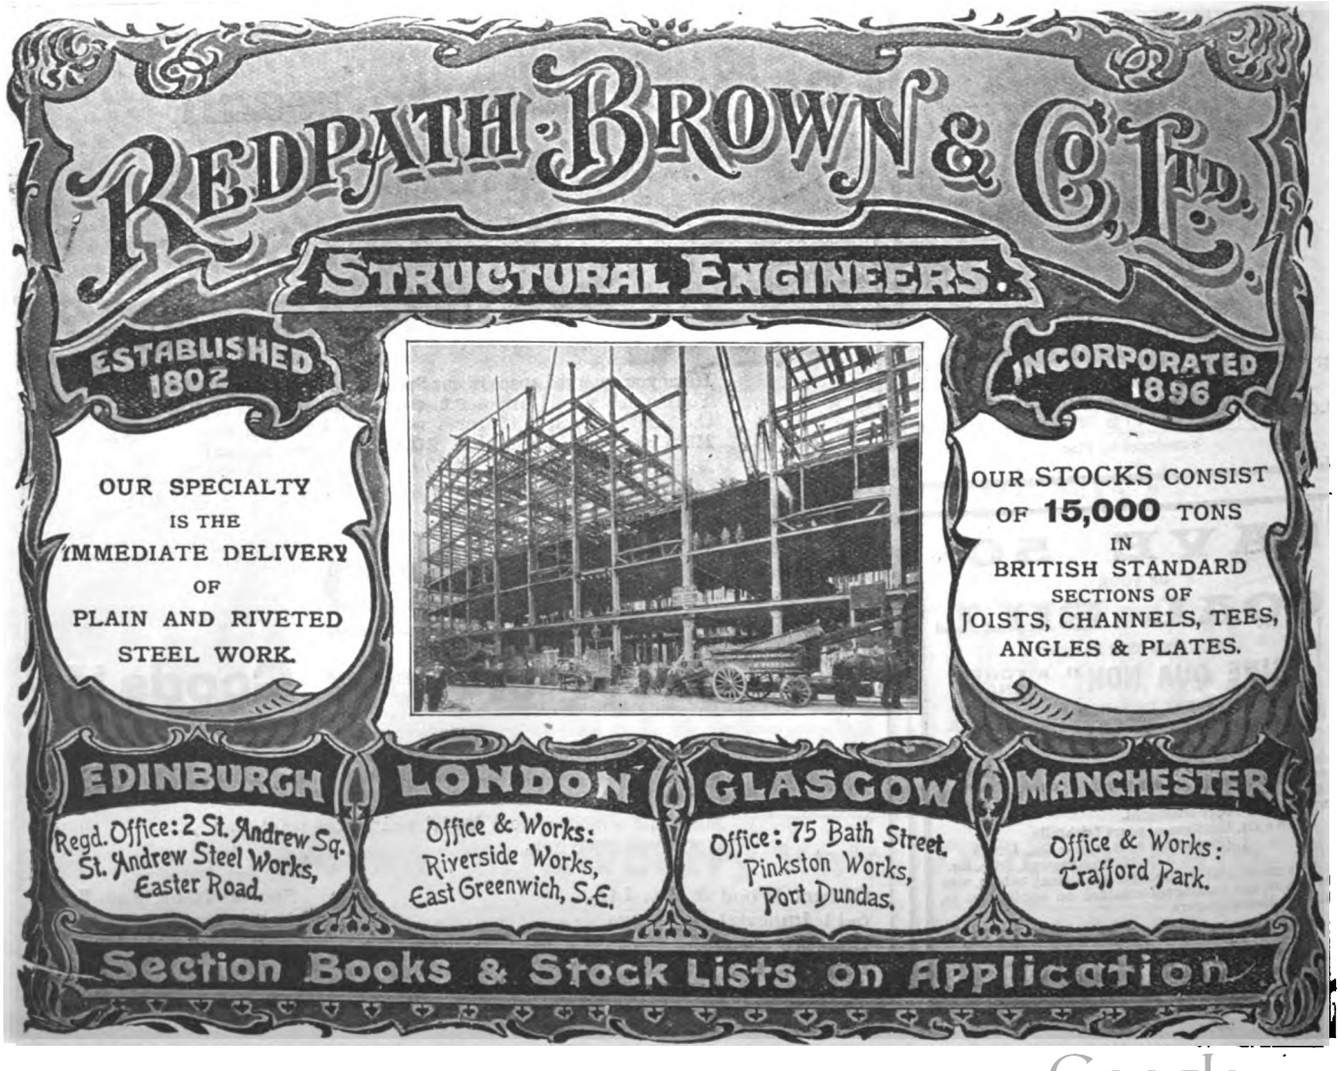
Mr. W. Noble Twelvetrees, M.I.Mech.E., &c., has removed to 195 Bedford Hill, S.W. His telephone number remains as before, viz. 1221 Battersea.

New buildings are to be erected for the Swanley and District Working Men's Club and Institute, at Swanley, Kent, during the early part of the year, at a cost of 2,000*l*.

The retort houses at the Municipal Gas Works, Burton-on-Trent, are to be partially reconstructed at a cost of 16,000*l*. The original scheme involved an outlay of 25,000*l*.

Mr. J. Keanie, contractor, Johnstone, N.B., has been awarded the contract for carrying out a sewage purification scheme at Johnstone, N.B. The amount involved is about 10,000*l*. There were about thirty other tenders.

The Wood Green District Council has decided to apply to Parliament for power to sell a public garden of 3 roods 14 poles, for which a music-hall syndicate has offered the council 8,000*l*.



Messrs. Hobday, Way & Co., engineers, of London and Birmingham, have purchased a big site at Northampton, known as Abbey Park, with the idea of erecting works on it at an early date. Mr. G. H. Stevenson, architect, Northampton, is acting for the purchasers.

Mr. C. A. Harrison, M.Inst.C.E., of Newcastle-on-Tyne, is to be engaged to examine and report upon the designs and schemes submitted to the Valley Bridge sub-committee, Scarborough, for the widening and strengthening of the Valley Bridge, which spans the valley dividing the South Cliff from the railway station and Scarborough.

The foundation stone was recently laid of the Grenville Hotel, of eighty rooms, at Bude. A wide verandah will extend along the whole of the south front, and in the centre is to be a tower with a flat roof. There will be two principal staircases, one at each end of the corridor, leading to the three floors above. The hotel is being built by Messrs. Pethick Bros., of Bude, from the plans of Mr. Hatchard-Smith, architect, London.

The Belfast Corporation last week adopted a scheme put forward on behalf of the joint public health and improvement committees, recommending the application for a loan of 96,000*l*. for the extinction of the existing slum areas in the centre of the city, the widening of certain thoroughfares, and the provision of breathing spaces in the interests of the general health of the community. It is calculated that the 2,000*l*. per annum required for the sinking fund and interest will be recovered from the increased rents.

Arrangements are being made to acquire from the Corporation of Dunfermline about twelve acres of moorland to

INFANT SCHOOL, BRIDGEND.

SOUTH DOOR, PATRIXBOURNE CHURCH.

the south-east of Townhill for the purpose of forming a "garden city," in accordance with the ideas of the Garden City Association. A number of local gentlemen have subscribed or promised 15,000*l.* It is proposed to erect a large number of houses which can be let at from 9*l.* to 11*l.* a year. The site is nearly two miles from Dunfermline proper, but it is not far from the recently introduced tramway system between Dunfermline and Townhill.

THE Northern Counties Federation of Building Trade Employers held their annual general meeting on the 16th inst. at Sunderland, under the presidency of Mr. J. Davison, of Stockton-on-Tees. The annual report stated that the local associations had maintained their position and had increased their membership. A canvass had been made amongst the sub-trades and merchants, many of whom had joined the association on the strength of the adoption of an inter-trading rule, as well as being able to rely upon the advantage of a strong and active federation. The election of officers resulted as follows:—Mr. Alexander Ross, South Shields, president; Mr. F. W. Ranken, Sunderland, vice-president; Mr. J. W. White, hon. treasurer. It was agreed to hold the next quarterly meeting at North Shields.

THE Cardiff technical schools committee received last week deputations concerning the proposed formation of a class for gasfitters. A deputation of operative and master plumbers objected to the teaching of joint-wiping; and, for the gas company, it was said that owing to the changes that had taken place in the utilisation of gas for heating and motive purposes gasfitters required to know more than had been previously required of them. After prolonged discussion it was decided to defer conclusion until the committee had obtained the advice of the City and Guilds of London Institute as to what could properly be included in a syllabus for plumbers and what in a syllabus for gasfitters.

MR. E. A. SANDFORD-FAWCETT, Local Government Board Inspector, held an inquiry at Chester on the 15th inst. regarding an application made by the Cheshire County Council for sanction to borrow 82,000*l.* for the extension of Upton Lunatic Asylum. Among the officials present was Mr. H. Beswick, the county architect. In course of the inquiry it was stated that the sum of 275,000*l.* had already been spent on the building. Accommodation is to be provided at Upton for 500 additional patients, of whom 100 would be private or paying patients. It is intended to build a new annexe for 440 patients and an epileptic ward for sixty female patients. Extensions are also required to the laundry and chapel. The estimated cost of the annexe is 65,891*l.*, and the female epileptic ward 5,328*l.*

THE Glasgow Institute of Architects held a meeting in the secretary's chambers, 115 St. Vincent Street, on the 15th inst., Mr. George Bell, F.R.I.B.A., president, in the chair. The Secretary submitted a report on the matters which had been dealt with by the Council since last meeting. A committee of the Council is at present considering the proposed new building by-laws framed by Glasgow Corporation. The arrangements for the Institute's exhibition of architectural work, to be held in the rooms, 35 Elmbank Crescent, are now almost completed, and the opening ceremony has been fixed for the evening of January 7 next. The Institute has decided to hold a special general meeting on the evening of January 12 to consider the subject of "Competitions," and Mr. A. N. Paterson, M.A., A.R.I.B.A., has agreed to open the meeting by delivering a paper on the subject.

TREVELYAN HALL, St. Ann's Lane, Westminster, was recently dedicated by the Bishop of Kensington. It adjoins the mission buildings of St. Matthew's. On the ground floor, in addition to the kitchen and an enlarged parish workers' room, are rooms for the parish nurses, waiting-room, boiler-room and lavatories. On the first floor, approached by a separate entrance, is the Trevelyan hall, of some 1,560 super feet. It is divisible by a large revolving partition. A painting by E. de Morgan entitled "Attainment" is the chief ornament of the interior. The wood dado and ceiling ribs

are painted a dark green, and the walls will be distempered a pale green. The building is warmed by hot-water radiators and lighted by electricity, a secondary system of gas lighting being provided. There are two emergency exits and staircases, as well as the main staircase. The frontage to St. Ann's Lane is terra cotta with some glazed brick. Messrs. Mark Fawcett & Co., Greenwich, were the sub-contractors for the fireproof flooring and steel roof principals. The work has been carried out from the designs of Mr. Harold S. Rogers, architect, of 7 Dean's Yard, by Messrs. F. C. Hoskins & Co., of 4 Tufton Street, S.W.

CALENDARS, DIARIES, &c., FOR 1910.

We have received calendars from the Federated Employers' Association, 8 King Street, Manchester. That of the Western Electric Company has the disadvantage of failing to show the date clearly except at a very short distance, as space reserved for the months is only a small portion of the whole mount. The Art Calendar of Messrs. Shaw & Sons, stationers, Fetter Lane, E.C., shows in the centre a well coloured sunset scene on the coast. The London and Lancashire Fire Insurance Company opportunely give a reminder on each page of their calendar as to the date in that particular month on which the various insurances expire (it might here be mentioned that the security of the firm amounts to over four and a half millions); this company also send us a very useful memorandum block, with a detachable page for every day of the year. It has been often said that handsome premises are one of the finest assets for any company; this truism is evidently acknowledged by the Edinburgh Life Assurance Company, for they put at the head of their admirably spaced calendar a view of their new head office at 26 George Street, Edinburgh, which has already been described and illustrated in *The Architect*; intending policy-holders will be interested to know that policies issued by December 31 at full yearly rates will rank for four full years' bonus additions at the division of surplus to be made on December 31, 1912; the company have divided over 3,150,000*l.* as bonuses since their foundation in 1823. A standing and hanging circular calendar comes from Messrs. W. Summerscales & Sons, Ltd., Phœnix Foundry, Keighley; the monthly cards extend to December 1911.

The City Diary, 1910 (the *City Press* Office, E.C., price 1*s.*) must have now firmly established itself in the desks and bookshelves of City men. The diary proper, with three days to a page, is inter-leaved with blotting-paper, and the binding will stand business wear and tear. The preliminary section affords full information as to each of the local authorities, &c., operating in the "one square mile." The members of the Corporation are stated alphabetically, and according to the wards; there is a full list of City churches and their incumbents, and details are given as to the Guilds. The other municipal, social, and philanthropic organisations of the City all come within its purview.

The Gloucester Railway Carriage and Wagon Company, Ltd., have issued their fifteenth "Gloucester" Diary. About one-half of the three hundred odd pages deal with matters connected with the company.

A waistcoat pocket diary has been issued by the Saxon Portland Cement Company, Ltd., Cambridge, which in a compact space provides room for much valuable note-making by a business man. A coupon in a pocket gives special facilities for insurance. A very neat stamp and ticket case in Russian leather, together with a diary for January, comes from the London and Lancashire Fire Insurance Company; the diary has all the usual information, and some more besides.

Another useful present is the handy blotting pad and diary of the Edinburgh Life Assurance Company.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

The 111th award of certificates to the students took place at the lecture theatre, Crystal Palace, on Friday, December 17, when Mr. W. M. Mordey, M.I.C.E., presided and delivered an instructive address to the large company present on the occasion. He said that it was extremely desirable that

engineers should be able to do mechanical work and take off their coats to do a job whenever it was requisite. The ability to do the minor details of work tended to efficiency, and whatever their remuneration was they should by their strenuousness make it palpable to their employers that they were worth all they got, or more. It was also desirable that they should keep posted well up to date in the knowledge of their work, and that they should at the same time acquire a high moral character, so as to reflect credit on the profession of engineering.

The long list of appointments gained by students of this school has recently been added to by a supplementary list which includes some very important and responsible positions, among which are the following:—C. R. S. Kirkpatrick, chief assistant to the London Port Authority; A. R. Roberts, assistant engineer to the Leith Dock Commission; B. Marsland, chief Government engineer, Queensland Railways; H. Sadler, resident engineer, Dover Admiralty Pier widening; A. S. Buckle, district engineer, Ceylon Government railway; J. L. Dixon, resident engineer, Aden Waterworks construction, Aden; H. M. Birch, executive engineer, P.W.D., British East Africa; J. D. Wilson, resident engineer, Grand Trunk Pacific Railway, British Columbia; J. G. Nachaty, first assistant engineer Egyptian State railways; C. O. Weller, chief assistant engineer, Bonguolla Railway, S.W. Africa.

CORRESPONDENCE.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Fresco Painting.

SIR,—With reference to the various articles *re* "Fresco Painting" that appeared in your last three issues, it will no doubt interest your readers to hear the opinion expressed by the late Mr. Fred. S. Barff, Professor of Chemistry to the Royal Academy, on the renowned durability of four paintings executed according to the famous "Keim process," by the Rev. J. A. Rivington:—

"The Rev. J. A. Rivington gave me four specimens of his painting to submit to any tests I pleased. Three of these were half protected and half exposed. No. I. was treated by me in the exposed part, first with a solution of oil of vitriol, one part oil of vitriol to four parts of water, for some minutes, after which I washed it in cold water. It was then treated with bromine water for some minutes; after that, to destroy the yellow tint given by the bromine water, and to further test it, it was washed with a solution of strong caustic soda. A few days after it was treated with saturated chlorine water. These tests proved that the protecting influence of the silicates is very great. Chlorine and bromine do not occur in the air, but they are most powerful bleaching agents, and therefore rapidly destroy unprotected colours.

"No. II. was kept moist for some time under a bell glass full of carbonic acid gas. I then placed it in water through which carbonic acid was passed continuously for twenty-four hours. This proves that the lime ground can resist the most powerful disintegrating agent which exists in the air.

"No. III. was placed for a week in a bell glass of sulphurous acid gas, and kept moist. The result is, that it resisted this most powerful disintegrating gas; it also resisted its bleaching powers. Sulphurous acid destroys substances by its becoming oxidised in the presence of moisture into sulphuric acid, which, continually applied, has a most destructive effect.

"My opinion, therefore, is that painting properly executed with these materials will resist the destructive influences in the air. The fourth specimen proves that however dirty a painting in these materials may become, it can be made as fresh as when new by simple washing.

"I have studied silicious painting for thirty years, and have therefore had some experience.

"FRED. S. BARFF, M.A., Cantab."

Mr. Frederick Shields gave his opinion on this process as follows:—

"The Keim process lends itself with fascinating facility to every purpose of the painter. There are no ditches and pitfalls. He may go straight ahead with his work, from beginning to end, at a sitting, or he may go on to-morrow to perfect what he has begun to-day. You lay your first touch tentatively; the ground sucks it in; you go on; you are astonished, you are delighted with the sympathy between the ground and the colours flowing from your brush. As you gain confidence you find that hue may be laid over hue in

clear translucent veils, as in pure water colour, without disturbing any of the under tints, and that the materials allow you to finish at once with a result brilliant and forcible, and astonishingly like pure fresco.

"White may be used for the lights, and glazed to any hue afterwards, adding to the solid appearance of the painting.

"Further, I can only say that if the report of the chemical authorities may be relied upon, concerning the durability of this process, especially under the evil conditions of the atmosphere of modern cities, so injurious to all previous methods of mural decoration, then one may boldly say 'This is what the ages have waited for. At last, Eureka!'

"FREDERICK SHIELDS."

In recent years the "Keim process" has been commercially exploited, and a new paint, based on the same principles, and possessing the same durable, weatherproof and artistic properties as the "Keim colours," has been brought upon the market under the name of "Perpetuin Mineral Paint," and is claimed to be the only paint of its kind in this country. It is equally suitable for artistic paintings and frescoes, as well as for ordinary painting of walls, both inside and outside.

I may add that Messrs. Pattenhausen Bros., 40 Great Tower Street, E.C., are the sole agents for the "Keim" colours, as well as for "Perpetuin" mineral paint, in case any of your readers might wish to apply for further particulars.—Yours respectfully, A. R. TROBST.

8 Crouch Hall Road, Crouch End, London, N.: Dec. 16.

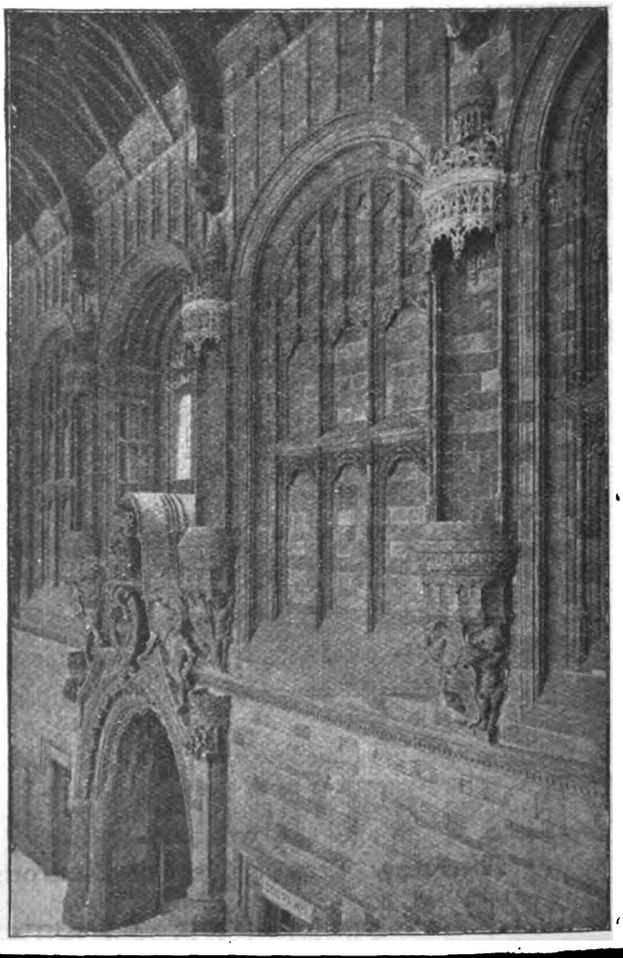
GERMAN ERRORS IN TOWN PLANNING.*

To insure that the powers given by the Town Planning Act shall be rightly used, all who know what are the evils existing both in our towns and in foreign towns should do their best to spread their knowledge and to try to induce our town councils and the Local Government Board to use their new powers very fully, but in doing so to avoid the mistakes which have been made and are still being made abroad.

* Abstract of a paper prepared by Mr. T. G. Horsfall in connection with the National Town Planning Congress held at the Westminster Palace Hotel, S.W., on December 14 and 15.

Fortunately the whole subject has been very carefully studied during the last thirty years by many German students of sociology and members of German municipal authorities. The results of much of the best German investigation have been conveniently summed up in courses of lectures on "Town Building," which were begun last year, and are being continued this year, at the Royal Technical University in Berlin.

Another lecture needs special mention on account of its very great value for English students of town planning. Bremen is the only large German town (228,000 inhabitants) which has houses resembling in size those in English towns. In the year 1880 its houses contained on an average 7.1 persons each, while the average for Berlin was 44.9, as compared with London 7.9 and England (without London) 5.8. But Bremen, like London, has been invaded by tenement houses, and the average number of inhabitants for one house reached 7.6 in 1890. Bremen has hitherto not had detailed town plans, but, partly in the hope of preventing the further replacement of cottages by tenement houses, it is now thinking of preparing them. The address referred to is by Professor Dr. Eberstadt on "Questions of Town Extension in Bremen and their General Significance," and was delivered to the Association of Architects in Bremen. Dr. Eberstadt has studied the housing question very carefully both in England and Germany; he is convinced of the great superiority of cottages to tenement houses, and the advice and warning which he has given respecting the use of town plans to the people of Bremen are as relevant to our needs as to theirs.



In the first lecture of the first series of Berlin lectures Professor Joseph Brix, discussing "The Objects of Town Building," says that to the domain of town building, for which town plans are needed, belong those parts of technical and artistic activity which seek to provide human beings with sites for their dwellings in harmony with the degree of civilisation attained by them, and to give them all that is needed as the foundations of healthy domestic life. The task of constructing and completing the individual house is that of the architect and of the decorator. The town builder is concerned only with the questions which rise when the mutual relations of the various dwellings and other buildings required by the community have to be determined. The questions which have to be dealt with may be classified under the head-

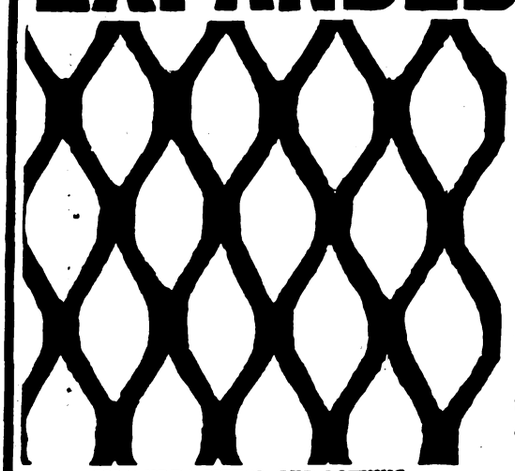
ings economic, hygienic, constructional, administrative, legislative, and, not least important, artistic or æsthetic.

As to how town plans can enable this to be done, German works on the subject give much valuable information. But it must be borne in mind that the town plan is only an instrument for attaining objects which its creators wish to attain. Some years ago the late Mr. Beck, for many years the Oberburgermeister of Mannheim, said that it is one of the duties of a community to give some compensation to the working classes for the smallness of their houses by providing every part of a town with planted walks, shrubberies, and playgrounds. Last year the Burgermeister of Gelsenkirchen (Herr von Wedelstaedt) said that, though no special laws prescribe it, there has been created for towns the sacred duty of protecting the health of the nation within their walls, and of insuring that workpeople and all citizens shall really find a home there in which life is worth living.

Professor Brix's remarks respecting the effect of the right formation of streets, of the use of the curve when it is appropriate, and the provision and right shaping of an adequate number of shrubberies and other open spaces should be carefully considered by all who can directly or indirectly influence the preparation of town plans.

Professor Genzmer rightly attributes to the breaking with tradition the dulness and monotony of the new districts of some of the German towns, the extension plans of which were prepared in the early years of the revival of town planning. The old towns, which ought to have been taken as models, were so full of beauty, he says, that probably beauty was supposed to be a thing which comes of itself. Towns are, he tells us, the form in stone of human culture, the most expressive monument of human history. The Germans have now recognised, says Professor Genzmer, that towns chiefly serve as dwelling places for beings who are not simply earners of money, but who enjoy life and beauty; and, following the impulse of their hearts, strive to create for their comfortable homes an environment ennobled by art.



Respecting the protection of health Professor Brix speaks of the need for insuring that enough light and sunshine shall reach all the inhabitants of towns and their dwellings, that tree-shaded roads and open spaces shall offer protection in hot weather, that wide spaces of grass shall exist to purify the air, that manufactories shall be confined to districts on the leeward side of towns, that sites shall be reserved for convalescent homes and forest schools, that there shall be an abundant supply of playgrounds and playing fields, and that too tall houses shall not be used as dwellings.

Those who wish to study this side of town planning more fully will find a perfect treasure house of suggestion in the works of Camillo Sitte, of Karl Henrici, and of Professor Stuebben, and also in the pages of the monthly magazine, "Der Staedtebau," which is now in its sixth year of publication. As Camillo Sitte's book has been translated into French under the title of "L'Art de bâtir les Villes," it may be of service to some persons who cannot read the other books.

Of all the reforms which can be effected by town planning there is no other more important than the supplying of a sufficient number of playgrounds and planted open spaces in the districts chiefly inhabited by workpeople. It cannot be doubted that by placing a playground, superintended by a well trained attendant to act as teacher of games as well as keeper of order, within reach of every child in our towns, we should effect a very great improvement in the physique, the intelligence, and conduct of our people. The German social reformers who demand a large supply of playgrounds in all new parts of towns, do not think of combating the weakness and disease due to wrong urban conditions simply by providing open spaces for play. Too often town children do not know how to use them rightly, or have no opportunity of using them. They are, therefore, making it obligatory that everywhere children shall give one afternoon a week to games in addition to two or three hours a week to gymnastics; and partly by the aid of the vast and active committee for promoting popular and children's games they have trained over twenty thousand teachers, men and women, to act as leaders of games.

Respecting building and the provision for traffic, Professor Brix urges that no extension of a town should take place except with the guidance of a plan prepared to provide for the probable needs of the next thirty years. This plan shall mark off (1) the land needed for roads, streets and public open spaces, and (2) the land which may be built on. The plan shall also divide the whole area into districts to be used respectively for residential, business and manufacturing pur-

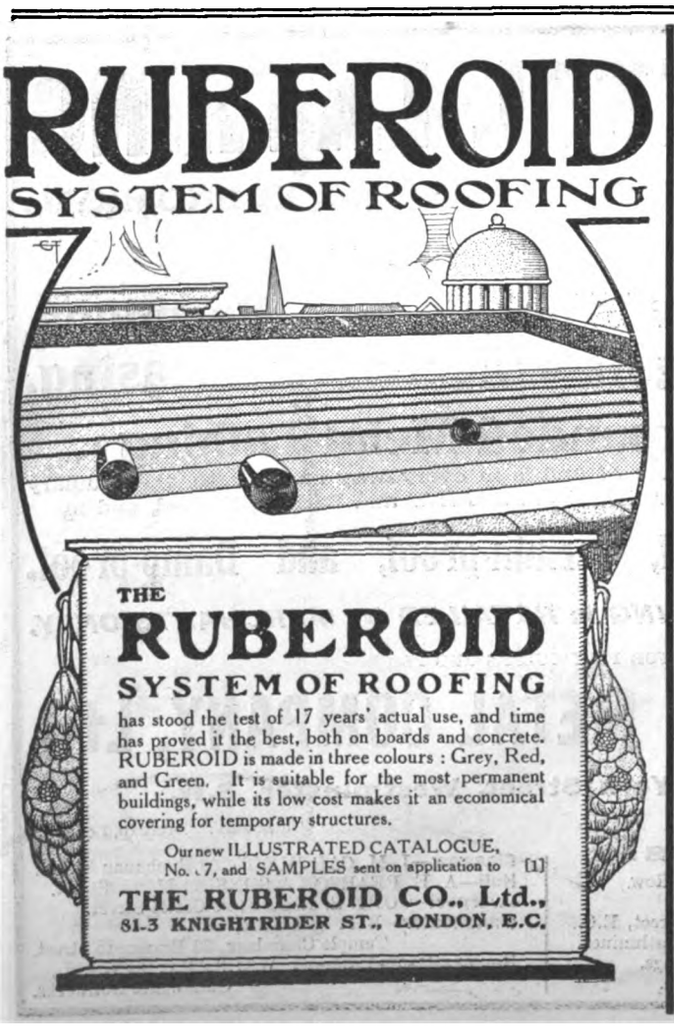
poses. He recommends that, as a rule, existing roads shall be kept. Adequate means of cheap and rapid transit from dwelling places to workshops and to places of recreation must also be provided, so that the cost of the dwelling shall bear a right relation to the income of the occupant.

It is of immense importance that all who have any connection with the making of town plans shall from the first seek to make impossible the substitution of tenement houses for one-family houses. Safeguards must also be provided against the rise in the price of urban and suburban land, in cost of building and in rents of houses. Such an increase has taken place in most large, and in many smaller German towns, in great measure as a result of the adoption of wrong principles in the preparation of town plans.

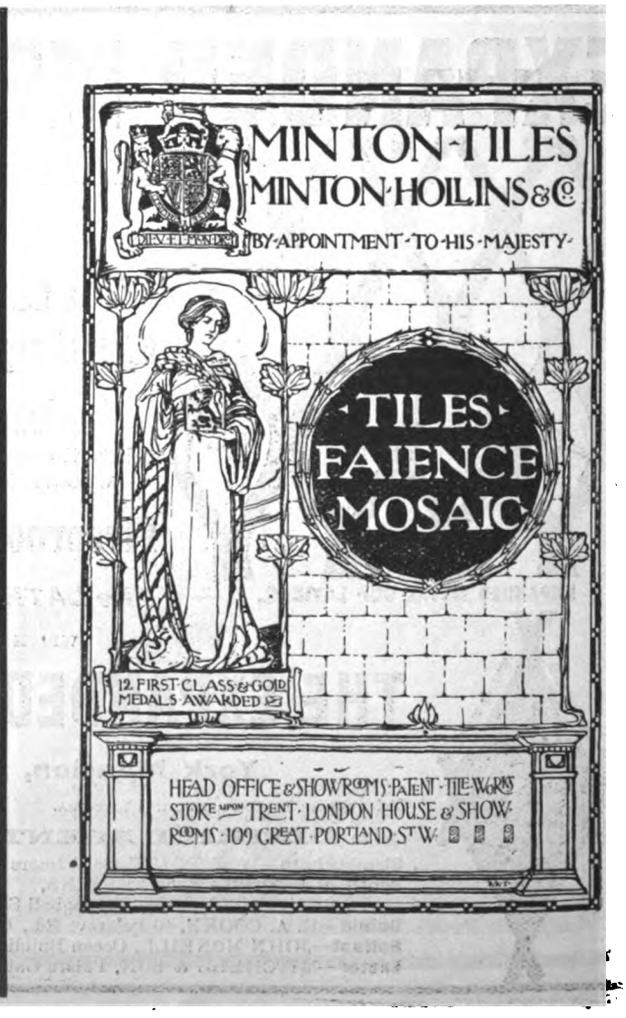
A very few figures will indicate the terrible prevalence of the tall tenement house in German towns, and the comparative smallness of English dwellings. The average population of a house in Berlin is over 77; in Breslau, Koenigsberg, Chemnitz, Stettin, Dresden and Magdeburg, about 30; in London about 7.6; and in Manchester, Birmingham, Sheffield, Leeds and Liverpool from 5 to 6.

The difference between the price of urban and suburban land here and in Germany is remarkably great. Mr. Pohlman, who has lived both in Germany and in England, says that although London is a much larger city than Berlin, the cost of land at distances of from three to ten miles from the centre of Berlin is from three to ten times as much as that of land at corresponding distances from the centre of London, and Mr. Boehmert says that land costs as a rule four or five times as much in German towns as in English towns of the same population.

The rents and the selling prices of a given area or cubic space of dwelling are also much higher in large and small towns in Germany than in English towns of similar size, and rents in German towns rise as the income of the population rises in a way unknown in this country.



The high rents lead to terrible overcrowding in most large towns. Professor Fuchs of Tübingen, has stated that while of six million dwellings in this country, three millions have five or more rooms, four-fifths of the dwellings in the large towns of Prussia have not more than three rooms. There is, as we know, much overcrowding in London, but while there about 300,000 live in dwellings each of only one room, in smaller Berlin 700,000 live in dwellings of that size. It is not only the poorer part of the working class which in Germany suffers from the insufficiency of space in its dwellings. In many towns all classes up to the well-to-do middle class are compelled by the high level of rents to restrict the number of the rooms they occupy to a much greater extent than are the corresponding classes here.



If similar evils are not to be created by town planning here, the causes of the evils which have been created in Germany must be known and avoided. Houses are sure to be made dearer than they would otherwise be:—(1) If the land on which they stand is of high price; (2) if an unnecessarily large quantity of material or an unnecessarily high quality of material or of workmanship has to be used in their construction; (3) if for any reason they are so large that but few persons can provide the capital needed for their construction; and (4) if either on account of houses being of great size, or because the area on which new houses can be built is restricted by municipal or other regulations, only a comparatively small number can be built at the same time.

All these causes of dearness are operant in German towns and suburbs. Land needed for sites is very dear; houses are so tall that the lower storeys have to be very substantially built, and an amount of material, far in excess of what is necessary for the enclosing walls of our cottages, has to be used; because the dwellings are so high, many staircases with wide steps and of fireproof construction, and fireproof separating walls are needed, with the result that the tenement house of the newest type is so large and costly that comparatively few persons can afford to build houses. It may be added that the building regulations of German towns, which are the complement of town plans, prohibit the building of dwellings on any street until the street is ready for traffic.

Dear land has so much influence in aggravating the bad influence of other causes of the dearness of German houses that it is desirable that its own causes should be known. There is only one real cause for dearness of land in towns, viz., excessive use. It is because the acre of land provides habitations for a much larger number of persons in German towns than in English towns that land is so much dearer there than here. The average number of inhabitants per acre is in Berlin about 180, and in London about sixty-two.

The excessive use of land in German towns is the direct

Digitized by Google

result of the adoption of a wrong principle in the preparation of the town plan. The German municipalities instead of providing that only those streets through which there will be much traffic, and those in which the buildings will be either the dwellings of well-to-do persons or public buildings, must be wide, have prepared plans which make great width necessary for nearly all residential streets.

Common widths in German towns for streets through which little traffic passes are 74 feet, 85 feet, and 112 feet, while in English towns many streets through which much traffic passes are not more than 36 or 39 feet wide. It is obvious that if a street, the cost of the land and construction of which has to be defrayed by the persons who build on each side of it, be wide and expensively sewered and paved, the houses built on it must be tall and deep, as no occupant of one small dwelling could afford to pay rent which included adequate interest on the cost of his house, its site, and half the width of the road. Tall, deep houses with back and side blocks have therefore had to be built on the wide German streets, and they enable such large sums to be received in rents from the use of their comparatively small sites that, whenever the by-laws allow such houses to be erected, if the town is one of increasing population, land becomes very dear as soon as the fact that tenement houses may be built on it is known.

The tall house containing many families is far less wholesome than the cottage. It is far less wholesome for its occupants because it is more difficult for the majority of them to reach the open air, and because many of its rooms are not nearly so accessible to light and air as are those of a cottage. It is far less wholesome for the rest of the inhabitants of the town because it interferes with the supply of light and air to other dwellings far more than do cottages.

(To be concluded.)

LONDON MASTER BUILDERS' ASSOCIATION.

THE Council of the above met on December 9 and 16, when the President (Mr. F. G. Rice) occupied the chair.

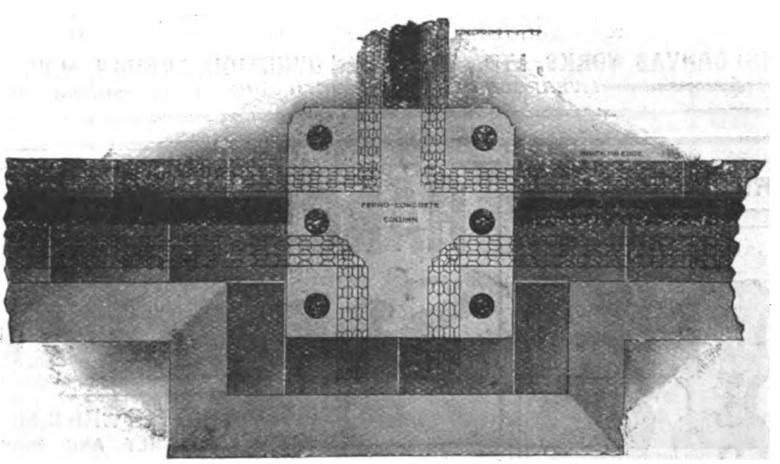
Matters of an important character were discussed and instructions given concerning them. The firms recommended by the organisation committee for election were adopted, and the Council felt that something should be done in connection with sub-contractors who wished to join the Association as associate members. With those who are purely builders' merchants there is no difficulty, but it was felt necessary to do something to enlist the cohesion of sub-contractors in case of labour troubles. A declaration to be given was adopted and a motion to amend the rules will be accordingly made at the next annual general meeting to meet these cases.

The quarterly financial statement was submitted and considered together with the investment account. Among other items cheques were drawn for the Association's subscription for 1909 to the National Federation, and contribution for the same period to the National Federation reserve fund.

It was decided to eliminate from the list of members those whose subscriptions were more than two years in arrear and from whom no satisfactory reply had been received to a recent communication.

The Council gave further consideration to the case of a builder who is contesting the decision of an arbitrator, and gave instructions accordingly.

The President (Mr. F. G. Rice) reported that he accepted an invitation to attend the conference on the apprenticeship question at the Mansion House on December 3, and reported the proceedings to the Council. It was regretted that no employer representing the building trade had an opportunity to speak at this meeting. A gentleman who, apparently, was not present, was announced to speak on behalf of the building trade, but he was in no way connected with the London Master Builders' Association, nor the National Federation of Building Trade Employers, nor even is he known as an employer. It would certainly be most desirable to enlist the sympathies and co-operation of the employers of the building trade if the movement is to be successful in the trade.



As a result of the conference with the Quantity Surveyors' Association the Council decided to send a copy of the following resolution, come to at the time, to every member of the Association:—"That this conference disapproves of the practice of asking for tenders in competition for works of a substantial value without quantities, prepared by a fully qualified surveyor, being supplied, and is of opinion that such quantities should be supplied in all cases when competitive estimates are invited for works expected to cost 500*l.* and upwards."

A deputation consisting of the President (Mr. F. G. Rice), Mr. W. Shepherd, Mr. J. Randall, and Mr. G. Bird Godson, together with representatives of the National Federation were received by the President and officers of the Royal Institute of British Architects on Monday, December 13, and discussed the question of bills of quantities being supplied. After a very pleasant and courteous interview the deputation left with the assurance that the matter would be laid before the R.I.B.A. Council. Mr. F. G. Rice and Mr. Wm. Shepherd spoke for the L.M.B.A., and Mr. Ernest J. Brown for the National Federation.

A communication from the London Association of Master Decorators was received, and it was decided to appoint the President and officers of the Association to meet the master decorators.

Several questions of interest regarding trade practice were considered, such as demarcation of work, and the Leicester arbitrator's decision as to plumbers' work.

The arrangements for the annual dinner in February next were left to the President.

Mr. L. Horner and Mr. G. Bird.Godson were deputed to act with Mr. J. Carmichael in matters relating to the ventilation, &c., of the new offices in Kingsway.

The following committee was elected to consider alterations necessary in the rules of the Association:—The President (Mr. F. G. Rice), Mr. L. Horner, Mr. G. Bird Godson, Mr. J. S. Holliday, Mr. W. Shepherd, Mr. Frank May, J.P., Mr. F. Higgs, and Mr. F. L. Dove, L.C.C.

The following members were elected to represent the L.M.B.A. on the National Federation Council and administrative Committee:—

Council:—The President (Mr. F. G. Rice), Mr. J. Carmichael, J.P., Mr. S. B. Depree, Mr. F. L. Dove, L.C.C., Mr. G. Bird Godson, Mr. L. Horner, Mr. J. S. Holliday, Mr. J. F. Parker, Mr. F. M. May, and Mr. A. W. Turnbull.

Administrative Committee:—Mr. B. I. Greenwood and Mr. W. Shepherd.

It was decided to inform the members of the L.M.B.A. that the rules relating to measurement of slating and tiling issued recently by the Master Slaters' Association had not been considered or approved of by this Council.

The meetings terminated after lengthy duration.

PUBLIC HEALTH EXHIBIT AT THE JAPAN-BRITISH EXHIBITION.

An interesting meeting was held last week at the administrative offices of the Japan-British Exhibition, when the first gathering of the public health and sanitation committee took place under the presidency of Mr. H. D. Searles-Wood, F.R.I.B.A.

The committee itself is formed as follows:—Mr. H. Adams, M.I.C.E.; Mr. T. W. Aldwinckle, F.R.I.B.A.; Mr. H. P. Boulnois, M.I.C.E.; Professor H. R. Kenwood, M.B.; Colonel J. Lane Motter, R.A.M.C., M.A., M.D.; Dr. Samuel Rideal, F.I.C.; Mr. H. Saxon Snell, F.R.I.B.A.; Mr. W. C. Tyndale, M.I.C.E.; Mr. J. E. Wilcox, M.I.C.E.; Mr. J. E. Wroth, M.I.C.E., of the London County Council; and (*ex officio*) Sir John Cockburn.

The effect of the meeting is that special efforts are to be made to insure that the public health and sanitation section, concerning as it does the welfare and comfort of the community, shall be one of the most important at next year's great undertaking, and shall bear a favourable comparison to the great demonstration to be made by our Japanese allies, who, in peace and war, have proved themselves to be distinguished sanitarians.

A classification for the section was agreed to which embraces schools, prisons, barracks, camps, building material, dairy appliances, apparatus for water supply, heating apparatus, lighting and ventilation, clothing, domestic appliances, means for the development of the physique, and so on.

In order to carry out the enormous amount of work which this represents it was decided to appoint provincial sub-committees for Leeds, Birmingham, Newcastle, Glasgow, Edinburgh, Cardiff, Liverpool, Manchester, Bristol, Dublin, and all the great industrial and mercantile centres.

A feature of the section is to be its attractiveness from a spectacular as well as from an educational point of view, and the arrangements providing for this, which will be a revelation to the public, were discussed at some length.

Altogether the proceedings were of an eminently satisfactory character, and concluded with the granting of applications to exhibit on the part of some of the leading British firms.

ADDITIONS TO THE ROYAL INFIRMARY, DERBY.

Fawcett's "Mon'lithcrete" Fire-Resisting Construction.

British Patent—No. 1408, January 20, 1909.

By this arrangement of web metal the whole is brought into tension.

The great success which has attended the introduction of the above invention in the United Kingdom during the past year has induced us to take out Patents throughout the principal countries of the world.

The extraordinary strength developed by "MON'LITHCRETE" Steel Girders (in combination with broken brick or other suitable concrete), their absolute reliability against shock or sudden collapse, and the low cost of the work, are qualities which recommend the use of this Construction in all cases where great strength is called for, where the spans required are considerable, or the thickness is limited.

The following are some of the points to which we would draw special attention :—

STRENGTH and DEFLECTION. These are calculated by the same rules as Lattice Girders, and will be found perfectly reliable.

EXPANSION. This is provided against by the flanges acting as Ties which are rigidly connected with the web metal. Twisted hoop steels are passed through the web openings and buried in the Concrete, thus acting as tension bond, and at the same time securing immunity from expansion between Girder and Girder.

FIXING. As Ballast Concrete is not necessary a fixing can easily be obtained to floor or ceiling.

TIME REQUIRED. It is manifest that the centring can be struck in as short a time as in the case of ordinary joists, or quicker than where reinforcing bars are used.

COST. Low cost. The cost is less than ordinary Steel Joists and Concrete, for the reason that the cost of "shearing" is not nearly so much as the price realisable from the superfluous web metal which is cut out.

For ESTIMATES, DRAWINGS, and FULL PARTICULARS, apply to

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable substance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

A MANUFACTURING firm, requiring extensions to their works, comprising dining halls (together with kitchens and stores) to accommodate 3,000 girls and 1,500 men respectively, will be glad to hear from architects who have had experience in designing and executing such buildings. Applicants must state their experience in designing buildings having good acoustic properties, besides being suitable for dining arrangements. See advertisement for full particulars.

The Building Surveyor, County Hall, Beverley.

The Tottenham local authorities have decided to sell 2½ acres of land which were originally purchased for the erection of workmen's dwellings to a German firm of clothiers. The price agreed upon is 1,000*l.* per acre.

The American Consul at Erfurt has furnished a report to his government of a new compound called "Spokonin," for allaying dust and improving the surface of roads, which has lately been prepared and tested in Germany with favourable results, and which has been pronounced by some technical observers as the best and most lasting road-covering yet brought out. The merits of this process were discussed at the recent Convention of Scientists and Physicians held at Salzburg, Germany. The process is secret, but it is known that coal-tar oils are the main ingredients. The heavy, penetrating qualities of the oils give great binding power to the composition. This, together with the pressure applied, produced a formation iron-like in its consistency, making the surface of the road, it is claimed, so smooth and hard that snow and rain water cannot penetrate. Another important advantage ascribed to spokonin is the sanitary nature of the material. It is claimed that the creosote present in the tars, together with the high temperature of the composition when applied, combine to destroy all the bacteria in the dirt, thus preventing the spread of disease from particles that may be blown off the surface.

"SINE QUA NON" KITCHEN RANGE.
RECENT TESTIMONIAL.
[Copy] 46 Newcastle St., London, E. June 8, 1909.
Gentlemen,—You will no doubt be pleased to hear that the "Sine Qua Non" Range we recently had from you is giving every satisfaction; we understand that the amount of coal consumed is practically one half of what the old range consumed.
We are, Gentlemen, yours faithfully,
(Signed for A. Eaton & Co., Ltd.,)
J. H. Stonehouse, Director.

THE London County Council have decided to proceed with the development of the Old Oak Estate, Hammersmith, by the erection of workmen's dwellings. The work will take ten years, and will cost 340,000*l.*, and details of it were given in our issue of the 17th inst.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against Imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORKER, Ltd.,

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

London Showrooms, Saracen's Head Buildings, Snow Hill, City, W. B. CLARKE, AGENT, where the "Drawwell" can be seen in action.

VARIETIES.

THE Worthing Theatre Royal was reopened on Monday, after extensive reconstruction at a cost of about 3,000*l.*, by Mr. Alfred Crouch, contractor, Worthing.

SHILDON Urban Council have sealed the agreement for the purchase of land for the new recreation ground—52 acres for 5,000*l.*—subject to the approval of the Local Government Board.

MR. FINCH, borough engineer of Bethnal Green, has been appointed the assistant engineer of the City under the scheme for the reorganisation of the City engineer's department.

THE Sheffield Corporation are framing new building by-laws. When they were first brought forward a number of objections were raised by the Chamber of Commerce and other parties. The City Council appointed a special committee, which has already interviewed some of the objectors. A meeting of a committee of the Chamber of Commerce was held last week to consider the present position of the proposals, and a deputation from it will wait upon the Corporation committee.

THE Coventry City Council have adopted a report received from the sewage farm committee recommending that 235 acres of land be purchased for the purpose of extending the sewage farm, and that application be made to the Local Government Board for sanction of a loan of 45,000*l.* The cost of the land is 17,000*l.*, and the remainder of the loan is made up of 24,900*l.* for works, 1,200*l.* for cost of bacteria plant, and 2,500*l.* for works of under drainage.

THE treasurer's committee of Edinburgh Town Council last week considered the advisability of the Town Council erecting at the Gorgie Markets shops or dwelling-houses for the purpose of encouraging the erection of other buildings there. It was agreed to modify the conditions and call the attention of builders to the change. In the event of no offer being forthcoming the committee would recommend the Town Council to consider whether operations should not be begun by the city.

MR. HERBERT L. G. RIGBY, late of Messrs. C. & J. Rigby, contractors of Holyhead Breakwater, the Somerset and Dorset Railway, and other important works, has left Manchester in order to represent in the South of England Messrs. W. Summerscales & Sons, Ltd., the makers of laundry and cooking machines. His address will be Chiswell House, 133 Finsbury Pavement, E.C., their London office, where his long engineering experience will be at the disposal of all requiring expert advice and for consultations.

MR. W. R. HOWELL, architect, Reading, has been instructed by the Reading Board of Guardians to prepare (1) the necessary drawings and specifications for the extension of the nurses' home and basement for storage purposes; and (2) alternative pencilled plans and estimates for the erection of a building on the workhouse premises to accommodate 120 and 150 respectively of the aged, infirm, and convalescent inmates of both sexes.

THE Royal Geographical Society have issued an appeal for funds for the enlargement or reconstruction of their premises in Savile Row, W. Some adjoining property has already been purchased at a cost of 13,500*l.* It is estimated that use could be made of the newly acquired property with an addition to the Society's capital of some 20,000*l.*, while the old and the new premises could be entirely reconstructed, so as to include an Explorers' Hall, for 50,000*l.*

AN unusually large number of plans for new buildings came up for consideration by the improvements and buildings committee of the Manchester Corporation on the 22nd inst. Some of them were for the provision of fine commercial premises, the erection of which is projected at an early date. The committee have also a considerable number of road widening and improvement schemes ready for putting into operation as soon as the state of the weather will allow.

THE Board of Trade have received an application from the Glasgow Master Plasterers' Association and the Glasgow Branch of the Scottish National Operative Plasterers' Federal Union for the appointment of a court of arbitration to decide questions which have arisen between the parties with regard to the rate of wages and the limitation of the number of apprentices. The Board of Trade have accordingly appointed a court consisting of his Honour Judge O'Connor (chairman), Mr. Jas. Platt (arbitrator from the employers' panel), and Mr. J. D. Prior (arbitrator from the labour panel).

THE special committee of the Glasgow Corporation which was appointed to make arrangements for the holding of an exhibition for the purpose of showing the public the

most up-to-date appliances for lighting, heating, and cooking purposes, with a view to the diminution of the smoke nuisance, recommend that as it appears to be impossible to obtain premises at a reasonable rent for holding the exhibition in February, and that as an exhibition later in the spring would probably be ineffective, the exhibition be delayed until the autumn, and that meantime the remit to endeavour to arrange for suitable premises made to the sub-committee be continued.

THE Warrington Town Council have the report prepared by Mr. John J. Webster, M.Inst.C.E., upon the competitive designs received from contractors for the reconstruction of Warrington Bridge. He stated that twenty contractors had sent in tenders, but as many of them had tendered upon the same design, the actual number of designs submitted was ten. After careful consideration he left the designs of Messrs. Christiani & Nielsen and the Considère Construction Company for final consideration. Although the design of Messrs. Christiani & Nielsen was excellent and had been submitted in a masterly manner, the advantages were in favour of the design submitted by the Considère Company. He therefore recommended that this system be adopted. The committee, after discussion, decided to invite Mr. Webster's attendance at a further meeting.

THE Wandsworth Board of Guardians some time ago appointed Mr. E. R. Dolby, M.Inst.C.E., M.I.Mech.E. (Dolby & Williamson), of Westminster, as consulting engineer for the installation of the heating and hot-water service and boiler-house plant in their new Poor-law Infirmary. The engineering scheme was submitted to the Local Government Board and approved by them. Tenders were obtained from seven firms of contractors, and the lowest tender—that of Messrs. Moorwood, Sons & Co., Ltd., of Sheffield and London —was accepted. The contract has just been signed, and work has begun in the fine new buildings erected in St. James's Road, Wandsworth Common, S.W., to the designs of Mr. J. S. Gibson, F.R.I.B.A.

THE Doncaster Rural District Council have approved of two schemes of sewerage and sewage disposal for the rapidly increasing parishes of Adwick-le-Street, Owston, and Skellow. For the parish of Adwick-le-Street it is proposed to lay main and branch sewers and convey the sewage to a pumping station, where it will be automatically lifted by centrifugal pumps driven by electric motors to the Woodlands sewage-disposal works, which will be increased in size. For Owston and Skellow parishes there will be considerable lengths of main and branch sewers to be laid which will deliver the sewage similarly to a pumping station, where it will be dealt with in like manner and pumped to a site to be treated. It is proposed to construct screening and detritus chambers, liquefying tanks, and percolating and sand filters. Application has now to be made to the Local Government Board for sanction to carry out the works, which have been designed by Messrs. D. Balfour & Son, of Newcastle-on-Tyne and London.

THE York Master Builders' and Contractors' Association held their annual meeting at the Old George Hotel, Pavement, last week. The Lord Mayor of York (Alderman J. Birch) presided, Mr. W. E. Biscomb occupying the vice-chair. The minutes and correspondence having been read, the Secretary read the report of the year's work, which was considered very satisfactory. The balance-sheet and financial statement showed a substantial balance in hand. The Lord Mayor was unanimously re-elected president of the association for 1910, and was complimented on his re-election to the office of Lord Mayor of York, and his recent election to the Freedom of the Worshipful Company of Plumbers, an honour not previously granted before to anyone outside of London. The freedom carries with it also a parliamentary vote for the City of London. Mr. W. E. Biscomb was unanimously re-elected vice-president, and Mr. C. Dent treasurer. In view of the local importance of the association and the growing scope for its work it was unanimously resolved to increase the executive committee from thirteen to eighteen members, and the following gentlemen were elected:—Councillors F. W. Birch, J. Hardgrave, G. Mansfield, J.P., and G. Sharp, and Messrs. W. Bellerby, J. W. Bellerby, W. Birch, J. W. Biscomb, T. Belt, H. Colman, R. Dent, J. Fairweather, H. Harrison, T. Rawling, G. Rawling, G. Turner, W. Usher and L. Wray. The secretary (Mr. J. Hague, solicitor, 29 High Ousegate) was unanimously re-elected. The Federation representatives for the year were re-elected, and consist of the president, vice-president and treasurer. It was decided to send four delegates to the National Federation meeting in London in January next.

TRADE NOTES.

The new National schools, Newport, I.W., erected from the plans of Mr. Percy G. Stone, F.R.I.B.A., F.S.A., architect, Newport, I.W., have been ventilated by means of Mackay's patent direct-acting ventilators of an ornamental design, and Mackay's improved fresh-air inlet panels, supplied by Messrs. Cousland & Mackay, ventilating engineers, Glasgow, the sole makers.

It is regrettable to learn that the handsome pavilion on the Britannia Pier at Great Yarmouth has been totally destroyed by fire. The building is, of course, not the well-known Uralite pavilion on the adjoining Wellington Pier. In the construction of the latter special precautions were taken to safeguard against any outbreak of fire.

A NORWICH INDUSTRY.

The constructional engineering department of Messrs. Boulton & Paul is the outcome of that steady expansion and ordered development of business which marks the successful firms of the country. This branch came into existence through the growth of the wood-framed buildings department, and served at first merely as an appendage to it. In a short while, however, its importance had so far increased as to necessitate its transformation into a distinct department with a specially trained staff and elaborate plant. A fine site has been allotted to it adjacent to the Great Eastern Railway, and here are always stored a large stock of steel bars, joists, angles, galvanised sheets, bolts, &c. The firm are consequently in a position to construct steel-framed buildings or extensions upon a very short notice. For such work Messrs. Boulton & Paul have the very great advantage of possessing a permanent buildings branch and wood works, whose resources can be concentrated on any contract undertaken, and by which they can supply all the labour and material required from foundations to roof, as well themselves carry out sub-contracts like lighting and heating. It can be hardly necessary to say that the firm are ready to put the services of their own specialists at the disposal of architects who have work of this character to design, but who may not have made a particular study of this class of construction.

The constructional engineering department have a goodly number of jobs to their credit—some of a simple nature, such as a steel-framed timber drying shed or a glazed garage roof, and others of a more complicated character. Among them may be mentioned various store buildings at Messrs. Coleman & Co., Norwich; the Military Riding School, Cambridge; an engineering workshop for Messrs. Laurence, Scott & Co., Ltd., Norwich; a timber drying shed at Portsmouth Dockyard; motor garages at Kingston-on-Thames, Altrincham, Leicester and Norwich; railway footbridges at Leytonstone and Krugersdorp, South Africa; emergency staircases and verandahs at Huddersfield Infirmary, and other works.

HENRY SAXON SNELL PRIZE.

The subject given in 1909 for the essay in competition for this prize was "The principles of heating and ventilating public buildings, with descriptive details and illustrations of the best systems." Fifteen essays were sent in, and they have been brought under the consideration of the Council of the Royal Sanitary Institute.

Acting upon the advice of the adjudicators appointed, the Council have awarded the prize offered of 50*l.* and a bronze medal of the institute, to Mr. Alfred E. Wheeler, West Ealing, writing under the motto "Helios."

Two of the other essays showed exceptional merit, and the Council have therefore decided to increase the amount of the award by 20*l.*, and to divide this amount equally between the writers of these two essays—to Mr. J. Roger Preston, M.R.San.I., Stourbridge, writing under the motto "Glow-worm," 10*l.*; and to Mr. E. Thomas Swinson, M.R.San.I., Feltham, writing under the motto "Dum Spiro Spero," 10*l.*

AUSTRALIA'S ASSOUAN.

By John Plummer, of Sydney.

Within the next few years Australia will be in possession of a dam eclipsing in volume and extent that at Assouan, which bids fair to assist in reviving the industrial marvels of ancient Egypt. The Assouan dam is at present the largest in the world. It impounds 37,000,000,000 gallons of water, as against the 33,000,000,000 which will be the

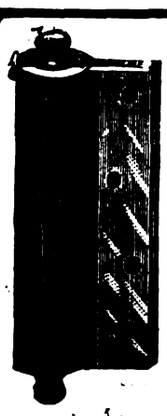
carrying capacity of Barren Jack, as the Australian dam is unworthily named; but while that at Assouan is shallow and stretches over sandy country in a hot climate, the Barren Jack waters will be contained between two ranges of mountains attaining an altitude of 2,000 feet, and situate in a comparatively cold climate. Allowing for the loss in the Assouan dam by evaporation and absorption, leading engineers hold that the storage value of the New South Wales work will be the greatest in existence. The waters of the Murrumbidgee, which, with its tributaries, will feed the dam, will be backed up about forty miles, the dam, when full, holding one and a half times the quantity of water contained in Sydney Harbour, the length of the immense walls thrown across the river being 900 feet by a height of 240 feet. The estimated cost is 850,000*l.*, against 2,450,000*l.* the expenditure at Assouan. The Murrumbidgee is one of the largest rivers in the Commonwealth, and the country lying between it and the Murray is known as Riverina. The soil is one of the richest in Australia, but the absence of the means of irrigation has necessitated its being used chiefly for pastoral purposes. The construction of the dam will cause all the low-lying lands beyond the gorge to become placed under water, and creating an inland sea of some twenty square miles. Before the dam could be constructed the waters of the Murrumbidgee had to be diverted by means of an artificial river channel. This was a formidable undertaking, but it was successfully accomplished. The place chosen for the construction of the dam is described as being an ideal one. "Solid red granite," says a recent visitor, "is the river bed, and red granite are the mountain sides. No better natural foundation for the work could be desired, and the narrowness of the river at this point adds to the facilities nature has provided. The rock that crops out on the slopes is the adamantine granite for which this mountain is famous, and the task of making the road to the scene of operations has been a hard one. Tons and tons of granite have had to be blasted away from the face of the hill, and the river bed is piled with huge boulders that have crashed down from above. It is the extent of the preliminary workings that gives one an idea of the vastness of what has to be accomplished. There are several fine examples of engineering and constructive skill that exist solely for the carrying on of the bigger work. When the dam is complete they will be done with and demolished. On the concrete platform stands a large wooden tower, 50 feet high. At the base of the tower stands a powerful engine, and from the summit the steel cable, 7 inches in circumference, stretches across the chasm to another tower on the opposite side. The second tower is but 33 feet high, but that end of the cable is over 50 feet above the other, the rocky platform on which the tower stands being 120 yards above the river. Twelve hundred feet is the span across the gorge, and the cable's centre sags deeply under its own immense weight. From it depends an iron cage and pulley, by means of which the heavy blocks of stone that are to go to build the dam will be handled and placed in position. The hundred yards down from the road to the river does not seem a great distance, but to the pedestrian the journey is a tedious one, for the precipitous nature of the slope necessitates a devious pathway. The rubbly earth that binds the granite to the mountain side offers none too sure a foothold, and steps have been constructed from top to bottom. These are simple but ingenious. A few thousand cement sacks filled with earth and placed in position—and you have steps with an excellent non-slipping surface ready for use. The workings on the slope are of an elaborate nature. A miniature telephone line connects the workers below with those up above, and chutes and cable ways facilitate the carrying of tools and building material. Dotted about are smiths' shop and engine sheds, and preparations are almost finished for the installation of a complete electric plant that will be needed as the work advances. Earth and stone from the hillside are wanted for the strengthening of the preliminary dam that has been erected to protect the foundations of the other, and men are busy getting material. The earth passes through several hands before it reaches the workmen on the dam. Men dig it out high up on the steep. Others cart it in wheelbarrows down a sloping plank-way, and send it hurtling down a 30-foot chute, where it is again collected and loaded on skips that glide down a cable to the dam top." The total cost of the undertaking will be over 1,500,000*l.*, but the whole of the expenditure will become recouped by the rentals of irrigation supplied and the improved values of the unalienated lands.

SHONE'S HYDRO-PNEUMATIC SEWERAGE SYSTEM

The ONLY Perfect System for Sewering Town Areas, Residences, Public Buildings.



In Operation at Eastbourne, Southampton, Warrington, Fenton, Henley-on-Thames, Houses of Parliament, Heston and Isleworth. Hampton Wick, Rangoon (Burma), Campos (Brazil), Slaughter Houses, Moscow, and numerous other places.

NEWMAN'S PATENT REGULATING HELICAL SPRING HINGES.

WITH PATENT STOP TO PREVENT OVERWINDING.
The power can be instantly taken off while the Hinges are being fixed and afterwards adjusted to close the door conveniently. They cannot be overwound.
Made in Brass and Iron, 3, 3½, 4, 4½, 5, 6, and 7 inches.

NEWMAN'S NORTON SYSTEM.
MADE IN MALLEABLE IRON.
The Best Door Spring and Check for closing doors without noise.
Pressure is direct, but diminishes pleasantly as door is opened.
Also made with Patent Regulator to latch stubborn bolts.

NEWMAN'S PATENT INVINCIBLE,
WITH AND WITHOUT PNEUMATIC CHECK.
Will hold door *rigidly to centre*, but diminishes in power as door is opened, allowing comfortable passage through.
The *Best* Spring to close door *against wind pressure*, and the most suitable for Banks, Schools, and other public buildings. Made in sizes to suit all doors.

Made solely by W. NEWMAN & SONS,
DOOR SPRING MAKERS AND BRASSFOUNDERS,
Established over 100 Years. HOSPITAL ST., BIRMINGHAM.

IRISH SLATES.

We have often felt that the resources of Ireland in its capability for supplying excellent building material have not been sufficiently exploited, but the merits of Killaloe slate are so well recognised that we were surprised to learn that in connection with the Blackrock Urban Council's scheme for the better housing of the working classes, in which some trouble arose through the contractor being unable to procure the requisite quantity of Killaloe slates, specified for in the contract, and in consequence of which a special meeting of the Urban Council was held to consider the matter, the correspondence between the contractor and the engineer and the Killaloe Slate Company, was before the meeting. It was pointed out that as the Killaloe Slate Company could not execute the order for 15,000 slates of a specified size within a week, the architect ordered the contractor to use Welsh slates. The Urban Council in the circumstances were satisfied that no other course was open to the contractor than to use the imported slates, though they said they sanctioned the course with extreme regret.

FITZALAN SQUARE, SHEFFIELD.

The necessity for an intelligent and artistic control of the laying-out of our cities is well emphasised by the present condition of Sheffield, as to which Mr. Charles Hadfield, one of the city's most respected architects, in a letter to the *Sheffield Daily Telegraph*, says:—

Your issue of the 9th inst. records "the transformation into an ornamental central square" of "Fitzalan Square, most misshapen and undignified of open spaces," as the writer described it in an article on our street architecture which appeared in "Sheffield in 1902," wherein he noted "that Sheffield, with its many natural advantages, is a place of lost opportunities, and must surely look to other things than its stones and streets to enforce its claims upon the admiration of posterity."

Since that date certain improvements have been effected in our public thoroughfares, but this last transformation, now a fair subject for open criticism, bearing as it does on the burning question of the hour, "æsthetic town planning," demands more than a passing notice from the architect, who realises how much hangs on scientific planning and the right laying out of building surroundings.

The writer ventured to remark in 1902 that "since our city's great schemes of central street improvement were inaugurated, there have been few, if any, important buildings erected which have not suffered in some degree from the distortion of their sites and approaches, and the fact that the new thoroughfares have been planned, apparently without a proper perception of the laws of composition and perspective," and with a resulting absence of properly contrived terminations and vistas. Typical instances, too, were cited, the new Town Hall site to wit, and, in the writer's own connection, the gas offices and Corn Exchange Buildings sites, all of which had suffered from commonplace street laying out.

The Fitzalan Square improvement was faulty in its initial planning under the Provisional Order of 1868; and no remedy, short of destruction, will suffice to undo the mistake made at that time.

Anyone passing down High Street to the Haymarket must be struck with the depressed appearance of the new Post Office Buildings, which look as if their base had bodily subsided into the earth, while the newly laid-out oval stone-balustraded terrace walls in the foreground have only served to accentuate the defect of the planning of the square and its approaches.

The Sheffield architects, I observe, are said to be responsible "for the design of the ornamental enclosure and its details, in consultation with the city engineer and his staff."

As one of the former, I venture, now that all is open to public view, respectfully to submit my criticisms of the undertaking, and to disclaim any responsibility for the result; and, knowing somewhat of mason's craft, I must own that I do not regret the city Council's action in rejecting the use of granite for the execution of so essentially commonplace a design.

The Brodick United Free Church congregation, N.B., are now to proceed with the erection of a new church and manse. Suitable sites have been granted.

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says:—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest."

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my ectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist, however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately, there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

GERMAN ERRORS IN TOWN PLANNING.*

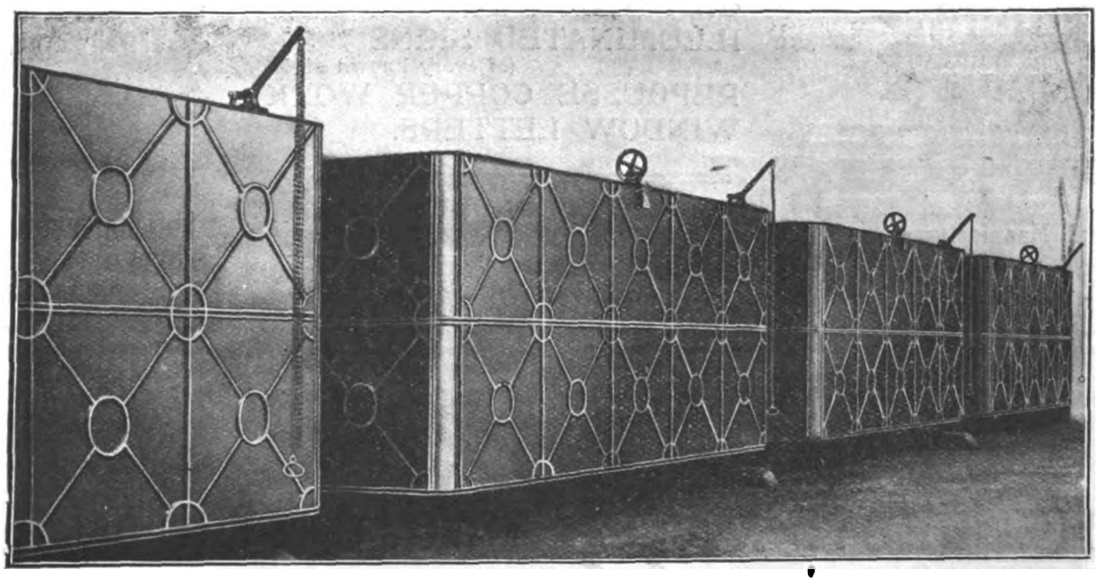
(Concluded from last week.)

WHILE it is admitted by all that the building of tall houses raises the rent and price of land, it is often asserted that this does not necessarily raise the rents of each separate dwelling, since the cost of the site of a dwelling forms but a small portion of the total cost of the dwelling, and by adding one storey or several storeys to the height the cost of the site is distributed over so many dwellings that the extra cost of the land is more than neutralised. This statement is fallacious. The addition of storeys beyond the number customary in any given locality raises the cost of all land round the sites of the tall houses, and thus adds greatly to the cost of roads, parks, playgrounds, and public gardens, and the sites of schools and other public buildings, and thus increases the amount of the rate and consequently the rent.

Even if the greater part of the increment of value of land due to excessive use, either by the building of tall houses or of a large number per acre of cottages, were recovered by a rate on the increment, the rate could not nearly compensate the community for the heavy outlay imposed through the raised price of the land, and the community receives no compensation at all for the injury to its health due to the same cause.

There are other causes of the dearness of German houses (causes which are not operative in this country), such as the influence of the Grundbuch system for officially recording the ownership and the degree of indebtedness of every plot of ground, and the predominant influence in German town councils of owners of houses and land.

Another factor is the difference between English and German rents of dwellings. Figures already given show that as a rule the German house contains far more persons than does the English house, but they do not give a true idea of the difference of size between the majority of the houses now being built in the two countries. A large proportion of the new houses built in German towns are larger than used to be built there, while the average house in England does not, except in London, hold more persons than did the average English house of twenty years ago. Probably the new house in large German towns to-day contains on an average at least a dozen households, whilst the average English house, if London be left out of account, contains only 1.08 households, or 5.2 persons.



The cost of a cottage for one English working-class family ranges from 150*l.* to 250*l.*, and the average may be taken as 200*l.* The cost in Germany of the tenement for each working-class family is not less than 200*l.*, so that the average cost of the house containing twelve tenements may be taken at 2,400*l.* Obviously, even if the population of England contained only the same proportion of persons with a given amount of capital as did that of Germany, there would be a vastly larger number of persons in it able at any given moment to expend 200*l.* on the building of a house if the need for new dwellings existed, than there would be in the German population of persons with 2,400*l.* to spare for the building of a house. Hence, other things being equal, the need for a large number of dwellings must be more rapidly supplied in this country than in Germany, and rents are not likely to be raised in the same degree here as in Germany by a short supply of new dwellings, and the price of land is not likely to be raised here as it is being raised there, by the rising rents of dwellings.

But other things are not equal in the two countries. When in Prussia a town plan is prepared and adopted, as already mentioned, no houses may be built on the new streets until they are nearly completed; and thus the rate at which the need for new houses can be supplied is still more retarded, and the rents of the houses are raised, and consequently the price of land raised also by the absence of competition in a way unknown here. In this country any number of new streets can be got ready to receive new lines of cottages in a very short time.

Cause No. 4, both of the dearness of German houses and for the slowness of the rate at which they can be built, is that in Germany far greater precautions are needed to guard against the danger of fire and of collapse in the case of tall buildings than are needed for cottages. That the German civic authorities have taken even more care than we believe to be necessary to guard against these dangers can be seen

* Abstract of a paper prepared by Mr. T. C. Horsfall in connection with the National Town Planning Congress held at the Westminster Palace Hotel, S.W., on December 14 and 15.

LARGEST MAKERS OF CAST IRON TANKS IN THE KINGDOM.
DRAWINGS, SPECIFICATIONS, AND ESTIMATES GIVEN UPON APPLICATION.

from the fact that they require two thick walls for all but the highest storeys of tenement houses, fire-walls to separate each house from its neighbours, and an ample supply of wide fireproof staircases for every house.

Many English people finding that the poorer inhabitants of German towns are much better clad and much cleaner than the corresponding classes in our towns, and seeing too that the German tenements are cleaner and neater than English town cottages, may easily attribute all this superiority to the influence of the German method of housing, and, therefore, indirectly to the German method of using town plans. They may at least suppose that the evils of that method are far less serious than they have been said to be. But this would be a great mistake.

In spite of the much better training of the Germans many of the tall houses show a lack of cleanliness, the death rate in their towns is much higher than in ours, and the rate of infant mortality is very much higher there than here. It is quite certain that if the population and the municipal governments of a large English town and a large German town were interchanged—say those of Hamburg and Manchester—that English people placed in the tall German houses would live miserably and die rapidly, while the new German rulers of Manchester by clearing small open spaces for playgrounds, and training children to use them, by creating numerous town gardens and planting with trees all streets and squares where it was possible to find space for them would soon make the poorer districts of Manchester much healthier and much less hideous than they are at present.

Professor E. Hoegg, speaking of Bremen, says:—"However badly a street may have been planned it will always have a much pleasanter effect if in it we see across front gardens full of red flowers, and under shady trees, comfortable two-storey houses, perhaps with red tiled roofs and covered with creepers, than is given by smart, over-decorated tenements of the Berlin pattern, six storeys in height, in a dusty street, much too wide for the houses which line it."

We can learn from Germany most important lessons with regard to residential streets, at any rate with regard to residential streets in those parts of towns where the houses are needed chiefly for families with small incomes; but the lessons to be learnt are mostly as to what kind of action should be avoided. But we can also learn from Germany the positive lesson that the town plan should prescribe that residential streets must run in the direction which makes it most easy to provide the chief rooms of every dwelling with abundant sunshine. From Port Sunlight, Earswick, Hampstead, and the co-operative colonies we should learn the lessons that the town plan and by-laws must keep land cheap by the restriction of the number of houses per acre of land, and by keeping down paved roads to the width which is really necessary.

Two of the uses made of town plans in Germany are wholly good, and should certainly be adopted here. In German town plans every street through which it is believed that much traffic will pass is laid of sufficient width for the expected amount of traffic, so that the inhabitants of German towns are spared that most useless kind of expenditure on which in this country millions of pounds have been wasted, the purchase at very high prices of the property on one side of a street only a few years old for the purpose of giving to the street the width which every man of experience knew from the beginning would soon be necessary.

In the case of streets which it is believed will have much traffic through them eventually, but which are not likely to be very much used for some years, the street is laid down with sufficient width between its two lines of buildings for the needs of the largest amount of traffic expected, but only the width of road immediately needed is paved, and the builders of houses have to provide front gardens and surrender them for incorporation in the street when the first paved portion of the street is found insufficient for the developing traffic.

It is probably impossible to tell yet whether the power given by the "Lex Adickes" to the municipal authority of Frankfort-on-Main, viz., the power to pool the land of the various owners in a new district and redistribute it among them, deducting from it the land needed for streets and other public purposes, will be needed here. No direct use has been made of the law in Frankfurt, and yet the law has been very useful as it has made land owners very amenable to the suggestion of the authorities and has greatly facilitated the task of inducing them to make reasonable agreements with each other. Essen, Baden and Hamburg, and the Swiss towns Zürich and Basel, have all given their town councils the power which is given to the town council of Frankfurt by the "Lex Adickes," and the last official Prussian Housing Bill contained a clause allowing all towns to obtain the power.
